	Python Module Index	389
	Index	393

EasyCV is an all-in-one computer vision toolbox based on PyTorch, mainly focus on self-supervised learning, image classification, metric-learning, object detection and so on.

PREPARE DATASETS

EasyCV provides various datasets for multi tasks. Please refer to the following guide for data preparation and keep the same data structure.

- *Image Classification*
- *Object Detection*
- *Self-Supervised Learning*
- *Pose (Keypoint)*
- *Image Segmentation*
- *Object Detection 3D*

1.1 Image Classification

- *Cifar10*
- *Cifar100*
- *Imagenet-1k*
- *Imagenet-1k-TFrecords*

1.1.1 Cifar10

The CIFAR-10 are labeled subsets of the [80 million tiny images](#) dataset. They were collected by Alex Krizhevsky, Vinod Nair, and Geoffrey Hinton.

It consists of 60000 32x32 colour images in 10 classes, with 6000 images per class.

There are 50000 training images and 10000 test images.

Here is the list of classes in the CIFAR-10: airplane, automobile, bird, cat, deer, dog, frog, horse, ship, truck.

For more detailed information, please refer to [CIFAR](#).

Download

Download data from cifar-10-python.tar.gz (163MB). And uncompress files to `data/cifar10`.

Directory structure is as follows:

```
data/cifar10
├── cifar-10-batches-py
│   ├── batches.meta
│   ├── data_batch_1
│   ├── data_batch_2
│   ├── data_batch_3
│   ├── data_batch_4
│   ├── data_batch_5
│   ├── readme.html
│   ├── read.py
│   └── test_batch
```

1.1.2 Cifar100

The CIFAR-100 are labeled subsets of the [80 million tiny images](#) dataset. They were collected by Alex Krizhevsky, Vinod Nair, and Geoffrey Hinton.

This dataset is just like the CIFAR-10, except it has 100 classes containing 600 images each.

There are 500 training images and 100 testing images per class.

The 100 classes in the CIFAR-100 are grouped into 20 superclasses. Each image comes with a “fine” label (the class to which it belongs) and a “coarse” label (the superclass to which it belongs).

For more detailed information, please refer to [CIFAR](#).

Download

Download data from cifar-100-python.tar.gz (161MB). And uncompress files to `data/cifar100`.

Directory structure should be as follows:

```
data/cifar100
├── cifar-100-python
│   ├── file.txt~
│   ├── meta
│   ├── test
│   └── train
```

1.1.3 Imagenet-1k

ImageNet is an image database organized according to the [WordNet](#) hierarchy (currently only the nouns).

It is used in the ImageNet Large Scale Visual Recognition Challenge(ILSVRC) and is a benchmark for image classification.

For more detailed information, please refer to [ImageNet](#).

Download

ILSVRC2012 is widely used, download it as follows:

1. Go to the [download-url](#), Register an account and log in .
2. Recommended ILSVRC2012, download the following files
 - Training images (Task 1 & 2). 138GB.
 - Validation images (all tasks). 6.3GB.
3. Unzip the downloaded file.
4. Using this [scrip](#) to get data meta.

Directory structure should be as follows:

```
data/imagenet
├── train
│   ├── n01440764
│   ├── n01443537
│   └── ...
├── val
│   ├── n01440764
│   ├── n01443537
│   └── ...
└── meta
    ├── train.txt
    ├── val.txt
    └── ...
```

1.1.4 Imagenet-1k-TFrecords

Original imagenet raw images packed in TFrecord format.

For more detailed information about Imagenet dataset, please refer to [ImageNet](#).

Download

1. Go to the [download-url](#), Register an account and log in .
2. The dataset is divided into two parts, [part0](#) (79GB) and [part1](#) (75GB), you need download all of them.

Directory structure should be as follows, put the image file and the idx file in the same folder:

```
data/imagenet
├── train
│   ├── train-00000-of-01024
│   ├── train-00000-of-01024.idx
│   ├── train-00001-of-01024
│   ├── train-00001-of-01024.idx
│   └── ...
├── validation
│   ├── validation-00000-of-00128
│   ├── validation-00000-of-00128.idx
│   ├── validation-00001-of-00128
│   ├── validation-00001-of-00128.idx
│   └── ...
```

1.2 Object Detection

- *PAI-iTAG detection*
- *COCO2017*
- *VOC2007*
- *VOC2012*

1.2.1 PAI-iTAG detection

PAI-iTAG is a platform for intelligent data annotation, which supports the annotation of various data types such as images, texts, videos, and audios, as well as multi-modal mixed annotation.

Please refer to [iTAG](#) for file format and data annotation.

Download

Download [SmallCOCO](#) dataset to data/demo_itag_coco, Directory structure should be as follows:

```
data/demo_itag_coco/
├── train2017
│   ├── train2017_20_local.manifest
│   └── val2017
│       ├── val2017_20_local.manifest
```

1.2.2 COCO2017

The COCO dataset is a large-scale object detection, segmentation, key-point detection, and captioning dataset. The dataset consists of 328K images.

The COCO dataset has been updated for several editions, and coco2017 is widely used. In 2017, the training/validation split was 118K/5K and test set is a subset of 41K images of the 2015 test set.

For more detailed information, please refer to [COCO](#).

Download

Download [train2017.zip](#) (18G) ,[val2017.zip](#) (1G), [annotations_trainval2017.zip](#) (241MB) and uncompress files to to data/coco2017.

Directory structure is as follows:

```
data/coco2017
├── annotations
│   ├── instances_train2017.json
│   └── instances_val2017.json
├── train2017
│   ├── 00000000000009.jpg
│   ├── 00000000000025.jpg
│   └── ...
└── val2017
    ├── 00000000000139.jpg
    ├── 00000000000285.jpg
    └── ...
```

1.2.3 VOC2007

PASCAL VOC 2007 is a dataset for image recognition. The twenty object classes that have been selected are:

- *Person*: person
- *Animal*: bird, cat, cow, dog, horse, sheep
- *Vehicle*: aeroplane, bicycle, boat, bus, car, motorbike, train
- *Indoor*: bottle, chair, dining table, potted plant, sofa, tv/monitor

Each image in this dataset has pixel-level segmentation annotations, bounding box annotations, and object class annotations.

For more detailed information, please refer to [voc2007](#).

Download

Download [VOCtrainval_06-Nov-2007.tar](#) (439MB) and uncompress files to to data/VOCdevkit.

Directory structure is as follows:

```
data/VOCdevkit
├── VOC2007
│   ├── Annotations
│   │   ├── 000005.xml
│   │   ├── 001010.xml
│   │   └── ...
│   ├── JPEGImages
│   │   ├── 000005.jpg
│   │   ├── 001010.jpg
│   │   └── ...
│   ├── SegmentationClass

│   │   ├── 001010.png
│   │   └── ...
│   ├── SegmentationObject
│   │   ├── 000005.png
│   │   ├── 001010.png
│   │   └── ...
│   ├── ImageSets
│   │   ├── Layout
│   │   │   ├── train.txt
│   │   │   ├── trainval.txt
│   │   │   └── val.txt
│   │   ├── Main
│   │   │   ├── train.txt
│   │   │   ├── val.txt
│   │   │   └── ...
│   │   └── Segmentation
│   │       ├── train.txt
│   │       ├── trainval.txt
│   │       └── val.txt
```

1.2.4 VOC2012

The PASCAL VOC 2012 dataset contains 20 object categories including:

- *Person*: person
- *Animal*: bird, cat, cow, dog, horse, sheep
- *Vehicle*: aeroplane, bicycle, boat, bus, car, motorbike, train
- *Indoor*: bottle, chair, dining table, potted plant, sofa, tv/monitor

Each image in this dataset has pixel-level segmentation annotations, bounding box annotations, and object class annotations.

For more detailed information, please refer to [voc2012](#).

Download

Download [VOCtrainval_11-May-2012.tar](#) (2G) and uncompress files to to data/VOCdevkit.

Directory structure is as follows:

```
data/VOCdevkit
├── VOC2012
│   ├── Annotations
│   │   ├── 000005.xml
│   │   ├── 001010.xml
│   │   └── ...
│   ├── JPEGImages
│   │   ├── 000005.jpg
│   │   ├── 001010.jpg
│   │   └── ...
│   ├── SegmentationClass
│   │   ├── 000005.png
│   │   ├── 001010.png
│   │   └── ...
│   ├── SegmentationObject

│   │       └── val.txt
```

1.3 Self-Supervised Learning

- *Imagenet-1k*
- *Imagenet-1k-TFrecords*

1.3.1 Imagenet-1k

Refer to *Image Classification: Imagenet-1k*.

1.3.2 Imagenet-1k-TFrecords

Refer to *Image Classification: Imagenet-1k-TFrecords*.

1.4 Pose

- *COCO2017*

1.4.1 COCO2017

The COCO dataset is a large-scale object detection, segmentation, key-point detection, and captioning dataset. The dataset consists of 328K images.

The COCO dataset has been updated for several editions, and coco2017 is widely used. In 2017, the training/validation split was 118K/5K and test set is a subset of 41K images of the 2015 test set.

For more detailed information, please refer to [COCO](#).

Download

Download it as follows:

1. Download data: [train2017.zip](#) (18G) , [val2017.zip](#) (1G)
2. Download annotations: [annotations_trainval2017.zip](#) (241MB)
3. Download person detection results: [HRNet-Human-Pose-Estimation](#) provides person detection result of COCO val2017 to reproduce our multi-person pose estimation results. Please download from [OneDrive](#) or [GoogleDrive](#) (26.2MB).

Then uncompress files to data/coco2017, directory structure is as follows:

```
data/coco2017
├── annotations
│   ├── person_keypoints_train2017.json
│   └── person_keypoints_val2017.json
├── person_detection_results
│   ├── COCO_val2017_detections_AP_H_56_person.json
│   └── COCO_test-dev2017_detections_AP_H_609_person.json
├── train2017
│   ├── 00000000000009.jpg
│   ├── 00000000000025.jpg
│   └── ...
└── val2017
    ├── 00000000000139.jpg
    ├── 00000000000285.jpg
    └── ...
```

1.5 Image Segmentation

- *COCO Stuff 164k*

1.5.1 COCO Stuff 164k

For COCO Stuff 164k dataset, please run the following commands to download and convert the augmented dataset.

```
# download
mkdir coco_stuff164k && cd coco_stuff164k
wget http://images.cocodataset.org/zips/train2017.zip
wget http://images.cocodataset.org/zips/val2017.zip
wget http://calvin.inf.ed.ac.uk/wp-content/uploads/data/cocostuffdataset/stuffthingmaps_
↪trainval2017.zip

# unzip
unzip train2017.zip -d images/
unzip val2017.zip -d images/
unzip stuffthingmaps_trainval2017.zip -d annotations/

# --nproc means 8 process for conversion, which could be omitted as well.
python tools/prepare_data/coco_stuff164k.py /path/to/coco_stuff164k --nproc 8
```

By convention, mask labels in `/path/to/coco_stuff164k/annotations/*2017/*_labelTrainIds.png` are used for COCO Stuff 164k training and testing.

The details of this dataset could be found at [here](#).

1.6 Object Detection 3D

- *NuScenes*

1.6.1 NuScenes

Download nuScenes V1.0 full dataset data and CAN bus expansion data [HERE](#). Prepare nusenes data by running:

```
python tools/prepare_data/prepare_nuscenes.py \
--root_path=./data/nuscenes \
--canbus_root_path=./data/canbus \
--out_dir=./data/nuscenes \
--version=v1.0
```

It will generate `nuscenes_infos_temporal_{train,val}.pkl` files.

The data structure is as follows:

```
data/nuscenes
├── can_bus
├── nuscenes-v1.0
│   ├── maps
│   └── samples
```

(continues on next page)

(continued from previous page)

		— sweeps
		— v1.0-test
		— v1.0-trainval
		— nusenes_infos_temporal_train.pkl
		— nusenes_infos_temporal_val.pkl

QUICK START

2.1 Prerequisites

- python \geq 3.6
- Pytorch \geq 1.5
- mmcv \geq 1.2.0
- nvidia-dali \geq 0.25.0

2.2 Installation

2.2.1 Prepare environment

1. Create a conda virtual environment and activate it.

```
conda create -n ev python=3.6 -y
conda activate ev
```

2. Install PyTorch and torchvision

The master branch works with **PyTorch 1.5.1** or higher.

```
conda install pytorch==1.7.0 torchvision==0.8.0 -c pytorch
```

3. Install some python dependencies

replace {cu_version} and {torch_version} to the version used in your environment

```
# install mmcv
pip install mmcv-full==1.4.4 -f https://download.openmmlab.com/mmcv/dist/{cu_
↪ version}/{torch_version}/index.html
# for example, install mmcv-full for cuda10.1 and pytorch 1.7.0
pip install mmcv-full==1.4.4 -f https://download.openmmlab.com/mmcv/dist/cu101/
↪ torch1.7.0/index.html

# install nvidia-dali
pip install http://pai-vision-data-hz.oss-cn-zhangjiakou.aliyuncs.com/third_party/
↪ nvidia_dali_cuda100-0.25.0-1535750-py3-none-manylinux2014_x86_64.whl
```

(continues on next page)

(continued from previous page)

```
# install common_io for MaxCompute table read (optional)
pip install https://pai-vision-data-hz.oss-cn-zhangjiakou.aliyuncs.com/third_party/
↪common_io-0.3.0-cp36-cp36m-linux_x86_64.whl
```

4. Install EasyCV

You can simply install easycv with the following command:

```
pip install pai-easycv
```

or clone the repository and then install it:

```
git clone https://github.com/Alibaba/EasyCV.git
cd easycv
pip install -r requirements.txt
pip install -v -e . # or "python setup.py develop"
```

5. Install pai_nni and blade_compression

When you use model quantize and prune, you need to install pai_nni and blade_compression with the following command:

```
# install torch >= 1.8.0
pip install torch==1.8.0 torchvision==0.9.0 torchaudio==0.8.0

# install mmdcv >= 1.3.0 (torch version >= 1.8.0 does not support mmdcv version < 1.3.
↪0)
pip install mmdcv-full==1.4.4 -f https://download.openmmlab.com/mmdcv/dist/{cu_
↪version}/{torch_version}/index.html

# install onnx and pai_nni
pip install onnx
pip install https://pai-nni.oss-cn-zhangjiakou.aliyuncs.com/release/2.5/pai_nni-2.5-
↪py3-none-manylinux1_x86_64.whl

# install blade_compression
pip install http://pai-vision-data-hz.oss-cn-zhangjiakou.aliyuncs.com/third_party/
↪blade_compression-0.0.1-py3-none-any.whl
```

6. If you want to use MSDeformAttn, you need to compiling CUDA operators

```
cd easycv/thirdparty/deformable_attention/
python setup.py build install
# unit test (should see all checking is True)
python test.py
cd ../../..
```

2.2.2 Verification

Simple verification

```
from easycv.apis import *
```

You can also verify your installation using following quick-start examples

2.3 Examples

- *Image classification example*
- *Self-supervised learning example*
- *object detection example*

SELF-SUPERVISED LEARNING MODEL ZOO

3.1 Pretrained models

3.1.1 MAE

Pretrained on **ImageNet** dataset.

3.1.2 Fast ConvMAE

Pretrained on **ImageNet** dataset.

The flops of Fast ConvMAE is about four times of MAE, because the mask of MAE only retains 25% of the tokens each forward, but the mask of Fast ConvMAE adopts a complementary strategy, dividing the mask into four complementary parts with 25% token each part. This is equivalent to learning four samples at each forward, achieving 4 times the learning effect.

3.1.3 DINO

Pretrained on **ImageNet** dataset.

3.1.4 MoBY

Pretrained on **ImageNet** dataset.

3.1.5 MoCo V2

Pretrained on **ImageNet** dataset.

3.1.6 SwAV

Pretrained on **ImageNet** dataset.

3.2 Benchmarks

For detailed usage of benchmark tools, please refer to benchmark [README.md](#).

3.2.1 ImageNet Linear Evaluation

3.2.2 ImageNet Finetuning

3.2.3 COCO2017 Object Detection

3.2.4 VOC2012 Aug Semantic Segmentation

DETECTION MODEL ZOO

Inference default use V100 16G.

4.1 YOLOX-PAI

Pretrained on COCO2017 dataset. (The result has been optimized with PAI-Blade, and only computes the model inference time. To learn about end2end inference time, you can refer to [export.md](#).)

4.2 ViTDet

Algorithm	Config	Params(backbone/total)	Train memory(GB)	inference
time(V100)(ms/img)	bbox_mAPval0.5:0.95	mask_mAPval0.5:0.95	Download	
(fp16) 138ms 50.65 45.41 model - log		ViTDet_MaskRCNN	vitdet_maskrcnn	86M/111M 13.3

4.3 FCOS

4.4 DETR

4.5 DINO

5.1 1. Code Style

We adopt [PEP8](#) as the preferred code style.

We use the following tools: [flake8](#) for linting and [isort](#) for formatting:

- [flake8](#): linter
- [yapf](#): formatter
- [isort](#): sort imports

Style configurations of [yapf](#) and [isort](#) can be found in [setup.cfg](#). We use [pre-commit](#) hook that checks and formats for [flake8](#), [yapf](#), [seed-isort-config](#), [isort](#), [trailing whitespaces](#), [fixes end-of-files](#), [sorts requirements.txt](#) automatically on every commit. The config for a pre-commit hook is stored in [.pre-commit-config](#). After you clone the repository, you will need to install initialize pre-commit hook.

```
pip install -r requirements/tests.txt
```

From the repository folder

```
pre-commit install
```

After this on every commit check code linters and formatter will be enforced.

If you want to use pre-commit to check all the files, you can run

```
pre-commit run --all-files
```

If you only want to format and lint your code, you can run

```
sh scripts/linter.sh
```

5.2 2. Test

5.2.1 2.1 Unit test

```
bash scripts/ci_test.sh
```

5.2.2 2.2 Test data storage

As we need a lot of data for testing, including images, models. We use git lfs to store those large files.

1. install git-lfs(version>=2.5.0)

for mac

```
brew install git-lfs
git lfs install
```

for centos, please download rpm from git-lfs github release [website](#)

```
wget http://101374-public.oss-cn-hangzhou-zmf.aliyuncs.com/git-lfs-3.2.0-1.el7.x86_64.rpm
sudo rpm -ivh git-lfs-3.2.0-1.el7.x86_64.rpm
git lfs install
```

for ubuntu

```
curl -s https://packagecloud.io/install/repositories/github/git-lfs/script.deb.sh | sudo_
↪bash
sudo apt-get install git-lfs
git lfs install
```

1. track your data type using git lfs, for example, to track png files

```
git lfs track "*.png"
```

1. add your test files to data/test/ folder, you can make directories if you need.

```
git add data/test/test.png
```

1. commit your test data to remote branch

```
git commit -m "xxx"
```

To pull data from remote repo, just as the same way you pull git files.

```
git pull origin branch_name
```

5.3 3. Build pip package

```
python setup.py sdist bdist_wheel
```

SELF-SUPERVISED LEARNING TUTORIAL

6.1 Data Preparation

To download the dataset, please refer to [prepare_data.md](#).

Self-supervised learning support imagenet(raw and tfrecord) format data.

6.1.1 Imagenet format

You can download Imagenet data or use your own unlabeled image data. You should provide a directory which contains images for self-supervised training and a filelist which contains image path to the root directory. For example, the image directory is as follows

```
images/
├── 0001.jpg
├── 0002.jpg
├── 0003.jpg
├── ...
└── 9999.jpg
```

the content of filelist is

```
0001.jpg
0002.jpg
0003.jpg
...
9999.jpg
```

6.2 Local & PAI-DSW

We use `configs/selfsup/mocov2/mocov2_rn50_8xb32_200e_jpg.py` as an example config in which two config variable should be modified

```
data_train_list = 'filelist.txt'
data_train_root = 'images'
```

6.2.1 Training

Single gpu:

```
python tools/train.py \  
    ${CONFIG_PATH} \  
    --work_dir ${WORK_DIR}
```

Multi gpus:

```
bash tools/dist_train.sh \  
    ${NUM_GPUS} \  
    ${CONFIG_PATH} \  
    --work_dir ${WORK_DIR}
```

- NUM_GPUS: number of gpus
- CONFIG_PATH: the config file path of a selfsup method
- WORK_DIR: your path to save models and logs

Examples:

Edit data_rootpath in the \${CONFIG_PATH} to your own data path.

```
GPUS=8  
bash tools/dist_train.sh configs/selfsup/mocov2/mocov2_rn50_8xb32_200e_jpg.py $GPUS
```

6.2.2 Export model

```
python tools/export.py \  
    ${CONFIG_PATH} \  
    ${CHECKPOINT} \  
    ${EXPORT_PATH}
```

- CONFIG_PATH: the config file path of a selfsup method
- CHECKPOINT: your checkpoint file of a selfsup method named as epoch_*.pth
- EXPORT_PATH: your path to save export model

Examples:

```
python tools/export.py configs/selfsup/mocov2/mocov2_rn50_8xb32_200e_jpg.py \  
    work_dirs/selfsup/mocov2/epoch_200.pth \  
    work_dirs/selfsup/mocov2/epoch_200_export.pth
```

6.2.3 Feature extract

Download `test_image`

```
import cv2
from easycv.predictors.feature_extractor import TorchFeatureExtractor

output_ckpt = 'work_dirs/selfsup/mocov2/epoch_200_export.pth'
fe = TorchFeatureExtractor(output_ckpt)

img = cv2.imread('248347732153_1040.jpg')
img = cv2.cvtColor(img, cv2.COLOR_BGR2RGB)
feature = fe.predict([img])
print(feature[0]['feature'].shape)
```

YOLOX-PAI TUTORIAL

7.1 Introduction

Welcome to YOLOX-PAI! YOLOX-PAI is an incremental work of YOLOX based on PAI-EasyCV. We use various existing detection methods and PAI-Blade to boost the performance. We also provide an efficient way for end2end object detection.

In brief, our main contributions are:

- Investigate various detection methods upon YOLOX to achieve SOTA object detection results.
- Provide an easy way to use PAI-Blade to accelerate the inference process.
- Provide a convenient way to train/evaluate/export YOLOX-PAI model and conduct end2end object detection.

To learn more details of YOLOX-PAI, you can refer to our [technical report](#) or [arxiv paper](#).

7.2 Data preparation

To download the dataset, please refer to [prepare_data.md](#).

Yolox support both coco format and [PAI-Itag detection format](#),

7.2.1 COCO format

To use coco data to train detection, you can refer to `configs/detection/yolox/yolox_s_8xb16_300e_coco.py` for more configuration details.

7.2.2 PAI-Itag detection format

To use pai-itag detection format data to train detection, you can refer to `configs/detection/yolox/yolox_s_8xb16_300e_coco_pai.py` for more configuration details.

7.3 Quick Start

To use COCO format data, use config file `configs/detection/yolox/yolox_s_8xb16_300e_coco.py`

To use PAI-Itag format data, use config file `configs/detection/yolox/yolox_s_8xb16_300e_coco_pai.py`

You can use the [quick_start.md](#) for local installation or use our provided docker images (for both training and inference).

7.3.1 Pull Docker

```
sudo docker pull registry.cn-shanghai.aliyuncs.com/pai-ai-test/pai-easycv:yolox-pai
```

7.3.2 Start Container

```
sudo nvidia-docker run -it -v path:path --name easycv_yolox_pai --shm-size=10g --  
network=host registry.cn-shanghai.aliyuncs.com/pai-ai-test/pai-easycv:yolox-pai
```

7.3.3 Train

Single gpu:

```
python tools/train.py \  
    ${CONFIG_PATH} \  
    --work_dir ${WORK_DIR}
```

Multi gpus:

```
bash tools/dist_train.sh \  
    ${NUM_GPUS} \  
    ${CONFIG_PATH} \  
    --work_dir ${WORK_DIR}
```

- NUM_GPUS: number of gpus
- CONFIG_PATH: the config file path of a detection method
- WORK_DIR: your path to save models and logs

Examples:

Edit `data_rootpath` in the `${CONFIG_PATH}` to your own data path.

```
GPUS=8
bash tools/dist_train.sh configs/detection/yolox/yolox_s_8xb16_300e_coco.py $GPUS
```

7.3.4 Evaluation

The pretrained model of YOLOX-PAI can be found [here](#).

Single gpu:

```
python tools/eval.py \
    ${CONFIG_PATH} \
    ${CHECKPOINT} \
    --eval
```

Multi gpus:

```
bash tools/dist_test.sh \
    ${CONFIG_PATH} \
    ${NUM_GPUS} \
    ${CHECKPOINT} \
    --eval
```

- CONFIG_PATH: the config file path of a detection method
- NUM_GPUS: number of gpus
- CHECKPOINT: the checkpoint file named as epoch_*.pth.

Examples:

```
GPUS=8
bash tools/dist_test.sh configs/detection/yolox/yolox_s_8xb16_300e_coco.py $GPUS work_
↪dirs/detection/yolox/epoch_300.pth --eval
```

7.3.5 Export model

```
python tools/export.py \
    ${CONFIG_PATH} \
    ${CHECKPOINT} \
    ${EXPORT_PATH}
```

For more details of the export process, you can refer to [export.md](#).

- CONFIG_PATH: the config file path of a detection method
- CHECKPOINT: your checkpoint file of a detection method named as epoch_*.pth.
- EXPORT_PATH: your path to save export model

Examples:

```
python tools/export.py configs/detection/yolox/yolox_s_8xb16_300e_coco.py \
    work_dirs/detection/yolox/epoch_300.pth \
    work_dirs/detection/yolox/epoch_300_export.pth
```

7.3.6 Inference

Download exported models(`preprocess`, `model`, `meta`) or export your own model. Put them in the following format:

```
export_blade/  
epoch_300_pre_notrt.pt.blade  
epoch_300_pre_notrt.pt.blade.config.json  
epoch_300_pre_notrt.pt.preprocess
```

Download `test_image`

```
import cv2  
from easycv.predictors import TorchYoloXPredictor  
  
output_ckpt = 'export_blade/epoch_300_pre_notrt.pt.blade'  
detector = TorchYoloXPredictor(output_ckpt, use_trt_efficientnms=False)  
  
img = cv2.imread('0000000017627.jpg')  
img = cv2.cvtColor(img, cv2.COLOR_BGR2RGB)  
output = detector.predict([img])  
print(output)  
  
# visualize image  
image = img.copy()  
for box, cls_name in zip(output[0]['detection_boxes'], output[0]['detection_class_names']  
→ '']):  
    # box is [x1,y1,x2,y2]  
    box = [int(b) for b in box]  
    image = cv2.rectangle(image, tuple(box[:2]), tuple(box[2:4]), (0,255,0), 2)  
    cv2.putText(image, cls_name, (box[0], box[1]-5), cv2.FONT_HERSHEY_SIMPLEX, 1.0, (0,0,  
→ 255), 2)  
  
cv2.imwrite('result.jpg', image)
```

IMAGE CLASSIFICATION TUTORIAL

8.1 Data Preparation

To download the dataset, please refer to [prepare_data.md](#).

Image classification support cifar and imagenet(raw and tfrecord) format data.

8.1.1 Cifar

To use Cifar data to train classification, you can refer to [configs/classification/cifar10/swintiny_b64_5e_jpg.py](#) for more configuration details.

8.1.2 Imagenet format

You can also use your self-defined data which follows `imagenet` format, you should provide a root directory which contains images for classification training and a filelist which contains image path to the root directory. For example, the image root directory is as follows

```
images/
├── 0001.jpg
├── 0002.jpg
├── 0003.jpg
├── ...
└── 9999.jpg
```

each line of the filelist consists of two parts, subpath to the image files starting from the image root directory, class label string for the corresponding image, which are separated by space

```
0001.jpg label1
0002.jpg label2
0003.jpg label3
...
9999.jpg label9999
```

To use Imagenet format data to train classification, you can refer to [configs/classification/imagenet/imagenet_rn50_jpg.py](#) for more configuration details.

8.2 Local & PAI-DSW

8.2.1 Training

Single gpu:

```
python tools/train.py \  
    ${CONFIG_PATH} \  
    --work_dir ${WORK_DIR}
```

Multi gpus:

```
bash tools/dist_train.sh \  
    ${NUM_GPUS} \  
    ${CONFIG_PATH} \  
    --work_dir ${WORK_DIR}
```

- NUM_GPUS: number of gpus
- CONFIG_PATH: the config file path of a image classification method
- WORK_DIR: your path to save models and logs

Examples:

Edit data_rootpath in the \${CONFIG_PATH} to your own data path.

```
single gpu training:  
```shell  
python tools/train.py configs/classification/cifar10/swintiny_b64_5e_jpg.py --work_dir_
↪work_dirs/classification/cifar10/swintiny --fp16
```  
  
multi gpu training  
```shell  
GPUS=8
bash tools/dist_train.sh configs/classification/cifar10/swintiny_b64_5e_jpg.py $GPUS --
↪fp16
```  
  
training using python api  
```python  
import easycv.tools

import os
config_path can be a local file or http url
config_path = 'configs/classification/cifar10/swintiny_b64_5e_jpg.py'
easycv.tools.train(config_path, gpus=8, fp16=False, master_port=29527)
```
```

8.2.2 Evaluation

Single gpu:

```
python tools/eval.py \
    ${CONFIG_PATH} \
    ${CHECKPOINT} \
    --eval
```

Multi gpus:

```
bash tools/dist_test.sh \
    ${CONFIG_PATH} \
    ${NUM_GPUS} \
    ${CHECKPOINT} \
    --eval
```

- CONFIG_PATH: the config file path of a image classification method
- NUM_GPUS: number of gpus
- CHECKPOINT: the checkpoint file named as epoch_*.pth

Examples:

```
single gpu evaluation
```shell
python tools/eval.py configs/classification/cifar10/swintiny_b64_5e_jpg.py work_dirs/
→classification/cifar10/swintiny/epoch_350.pth --eval --fp16
```

multi-gpu evaluation

```shell
GPUS=8
bash tools/dist_test.sh configs/classification/cifar10/swintiny_b64_5e_jpg.py $GPUS work_
→dirs/classification/cifar10/swintiny/epoch_350.pth --eval --fp16
```

evaluation using python api
```python
import easycv.tools

import os
os.environ['CUDA_VISIBLE_DEVICES']='3,4,5,6'
config_path = 'configs/classification/cifar10/swintiny_b64_5e_jpg.py'
checkpoint_path = 'work_dirs/classification/cifar10/swintiny/epoch_350.pth'
easycv.tools.eval(config_path, checkpoint_path, gpus=8)
```
```

8.2.3 Export model for inference

```

If SyncBN is configured, we should replace it with BN in config file
```python
imagenet_rn50.py
model = dict(
 ...
 backbone=dict(
 ...
 norm_cfg=dict(type='BN')), # SyncBN --> BN
 ...)
...

```shell
python tools/export.py configs/classification/cifar10/swintiny_b64_5e_jpg.py \
    work_dirs/classification/cifar10/swintiny/epoch_350.pth \
    work_dirs/classification/cifar10/swintiny/epoch_350_export.pth
...

or using python api
```python
import easycv.tools

config_path = './imagenet_rn50.py'
checkpoint_path = 'oss://pai-vision-data-hz/pretrained_models/easycv/resnet/resnet50.pth'
export_path = './resnet50_export.pt'
easycv.tools.export(config_path, checkpoint_path, export_path)
...

```

### 8.2.4 Inference

Download [test\_image]([http://pai-vision-data-hz.oss-cn-zhangjiakou.aliyuncs.com/data/cifar10/qince\\_data/predict/aeroplane\\_s\\_000004.png](http://pai-vision-data-hz.oss-cn-zhangjiakou.aliyuncs.com/data/cifar10/qince_data/predict/aeroplane_s_000004.png))

```

```python
import cv2
from easycv.predictors.classifier import TorchClassifier

output_ckpt = 'work_dirs/classification/cifar10/swintiny/epoch_350_export.pth'
tcls = TorchClassifier(output_ckpt)

img = cv2.imread('aeroplane_s_000004.png')
# input image should be RGB order
img = cv2.cvtColor(img, cv2.COLOR_BGR2RGB)
output = tcls.predict([img])
print(output)
...

```

FILE TUTORIAL

The file module of easycv supports operations both on local and oss files, oss introduction please refer to: <https://www.aliyun.com/product/oss>.

If you operate oss files, you need refer to *access_oss* to authorize oss first.

9.1 Support operations

9.1.1 access_oss

Authorize oss.

Method1:

```
from easycv.file import io
io.access_oss(
    ak_id='your_accesskey_id',
    ak_secret='your_accesskey_secret',
    hosts='your_endpoint' or ['your_endpoint1', 'your_endpoint2'],
    buckets='your_bucket' or ['your_bucket1', 'your_bucket2'])
```

Method2:

Add oss config to your local file ~/.ossutilconfig, as follows: More oss config information, please refer to: https://help.aliyun.com/document_detail/120072.html

```
[Credentials]
language = CH
endpoint = your_endpoint
accessKeyID = your_accesskey_id
accessKeySecret = your_accesskey_secret
[Bucket-Endpoint]
bucket1 = endpoint1
bucket2 = endpoint2
```

If you want to modify the path of the default oss config file (~/.ossutilconfig), you can do as follows:

```
$ export OSS_CONFIG_FILE='your oss config file path'
```

Then run the following command, the config file will be read by default to authorize oss.

```
from easycv.file import io
io.access_oss()
```

Method3:

Set environment variables as follow, EasyCV will automatically parse environment variables for authorization:

```
import os

os.environ['OSS_ACCESS_KEY_ID'] = 'your_accesskey_id'
os.environ['OSS_ACCESS_KEY_SECRET'] = 'your_accesskey_secret'
os.environ['OSS_ENDPOINTS'] = 'your endpoint1,your endpoint2' # split with ","
os.environ['OSS_BUCKETS'] = 'your bucket1,your bucket2' # split with ","
```

9.1.2 open

Support w,wb, a, r, rb modes on oss path. Local path is the same usage as the python build-in open.

Example for oss:

io.access_oss please refer to [access_oss](# access_oss).

```
from easycv.file import io

io.access_oss('your oss config')

# Write something to a oss file.
with io.open('oss://bucket_name/demo.txt', 'w') as f:
    f.write("test")

# Read from a oss file.
with io.open('oss://bucket_name/demo.txt', 'r') as f:
    print(f.read())
```

Example for local:

```
from easycv.file import io

# Write something to a oss file.
with io.open('/your/local/path/demo.txt', 'w') as f:
    f.write("test")

# Read from a oss file.
with io.open('/your/local/path/demo.txt', 'r') as f:
    print(f.read())
```

9.1.3 exists

Whether the file exists, same usage as `os.path.exists`. Support local path and oss path.

Example for oss:

`io.access_oss` please refer to `[access_oss](# access_oss)`.

```
from easycv.file import io

io.access_oss('your oss config')

ret = io.exists('oss://bucket_name/dir')
print(ret)
```

Example for Local:

```
from easycv.file import io

ret = io.exists('oss://bucket_name/dir')
print(ret)
```

9.1.4 move

Move src to dst, same usage as `shutil.move`. Support local path and oss path.

Example for oss:

`io.access_oss` please refer to `[access_oss](# access_oss)`.

```
from easycv.file import io

io.access_oss('your oss config')

# move oss file to local
io.move('oss://bucket_name/file.txt', '/your/local/path/file.txt')
# move oss file to oss
io.move('oss://bucket_name/dir1/file.txt', 'oss://bucket_name/dir2/file.txt')
# move local file to oss
io.move('/your/local/file.txt', 'oss://bucket_name/file.txt')
# move directory
io.move('oss://bucket_name/dir1/', 'oss://bucket_name/dir2/')
```

Example for local:

```
from easycv.file import io

# move local file to local
io.move('/your/local/path1/file.txt', '/your/local/path2/file.txt')
# move local dir to local
io.move('/your/local/dir1', '/your/local/dir2')
```

9.1.5 copy

Copy a file from src to dst. Same usage as `shutil.copyfile`. If you want to copy a directory, please refer to `[copy-tree](# copytree)`.

Example for oss:

`io.access_oss` please refer to `[access_oss](# access_oss)`.

```
from easycv.file import io

io.access_oss('your oss config')

# Copy a file from local to oss:
io.copy('/your/local/file.txt', 'oss://bucket/dir/file.txt')
# Copy a oss file to local:
io.copy('oss://bucket/dir/file.txt', '/your/local/file.txt')
# Copy a file from oss to oss::
io.copy('oss://bucket/dir/file.txt', 'oss://bucket/dir/file2.txt')
```

Example for local:

```
from easycv.file import io

# Copy a file from local to local:
io.copy('/your/local/path1/file.txt', '/your/local/path2/file.txt')
```

9.1.6 copytree

Copy files recursively from src to dst. Same usage as `shutil.copytree`.

If you want to copy a file, please use `[copy](# copy)`.

Example for oss:

`io.access_oss` please refer to `[access_oss](# access_oss)`.

```
from easycv.file import io

io.access_oss('your oss config')

# copy files from local to oss
io.copytree(src='/your/local/dir1', dst='oss://bucket_name/dir2')
# copy files from oss to local
io.copytree(src='oss://bucket_name/dir2', dst='/your/local/dir1')
# copy files from oss to oss
io.copytree(src='oss://bucket_name/dir1', dst='oss://bucket_name/dir2')
```

Example for local:

```
from easycv.file import io

# copy files from local to local
io.copytree(src='/your/local/dir1', dst='/your/local/dir2')
```

9.1.7 listdir

List all objects in path. Same usage as `os.listdir`.

Example for oss:

`io.access_oss` please refer to `[access_oss](# access_oss)`.

```
from easycv.file import io

io.access_oss('your oss config')

ret = io.listdir('oss://bucket/dir', recursive=True)
print(ret)
```

Example for local:

```
from easycv.file import io

ret = io.listdir('oss://bucket/dir', recursive=True)
print(ret)
```

9.1.8 remove

Remove a file or a directory recursively. Same usage as `os.remove` or `shutil.rmtree`.

Example for oss:

`io.access_oss` please refer to `[access_oss](# access_oss)`.

```
from easycv.file import io

io.access_oss('your oss config')

# Remove a oss file
io.remove('oss://bucket_name/file.txt')
# Remove a oss directory
io.remove('oss://bucket_name/dir/')
```

Example for local:

```
from easycv.file import io

# Remove a local file
io.remove('/your/local/path/file.txt')
# Remove a local directory
io.remove('/your/local/dir/')
```

9.1.9 rmtree

Remove directory recursively, same usage as `shutil.rmtree`.

Example for oss:

`io.access_oss` please refer to `[access_oss](# access_oss)`.

```
from easycv.file import io

io.access_oss('your oss config')

io.remove('oss://bucket_name/dir_name/')
```

Example for local:

```
from easycv.file import io

io.remove('/your/local/dir/')
```

9.1.10 makedirs

Create directories recursively, same usage as `os.makedirs`.

Example for oss:

`io.access_oss` please refer to `[access_oss](# access_oss)`.

```
from easycv.file import io

io.access_oss('your oss config')

io.makedirs('oss://bucket/new_dir/')
```

Example for local:

```
from easycv.file import io

io.makedirs('/your/local/new_dir/')
```

9.1.11 isdir

Return whether a path is directory, same usage as `os.path.isdir`.

Example for oss:

`io.access_oss` please refer to `[access_oss](# access_oss)`.

```
from easycv.file import io

io.access_oss('your oss config') # only oss file need, refer to `IO.access_oss`
ret = io.isdir('oss://bucket/dir/')
print(ret)
```

Example for local:

```
from easycv.file import io

ret = io.isdir('your/local/dir/')
print(ret)
```

9.1.12 isfile

Return whether a path is file object, same usage as `os.path.isfile`.

Example for oss:

`io.access_oss` please refer to `[access_oss](# access_oss)`.

```
from easycv.file import io

io.access_oss('your oss config')
ret = io.isfile('oss://bucket/file.txt')
print(ret)
```

Example for local:

```
from easycv.file import io

ret = io.isfile('/your/local/path/file.txt')
print(ret)
```

9.1.13 glob

Return a list of paths matching a pathname pattern.

Example for oss:

`io.access_oss` please refer to `[access_oss](# access_oss)`.

```
from easycv.file import io

io.access_oss('your oss config')

ret = io.glob('oss://bucket/dir/*.txt')
print(ret)
```

Example for local:

```
from easycv.file import io

ret = io.glob('/your/local/dir/*.txt')
print(ret)
```

9.1.14 size

Get the size of file path, same usage as `os.path.getsize`.

Example for oss:

`io.access_oss` please refer to `[access_oss](# access_oss)`.

```
from easycv.file import io

io.access_oss('your oss config')

size = io.size('oss://bucket/file.txt')
print(size)
```

Example for local:

```
from easycv.file import io

size = io.size('/your/local/path/file.txt')
print(size)
```

V 0.11.0 (09/05/2023)

10.1 Highlights

- Support EasyCV as a plug-in for [modelscope](<https://github.com/modelscope/modelscope>).

V 0.10.0 (06/03/2023)

11.1 Highlights

- Support STDC, STGCN, ReID and Multi-len MOT.
- Support multi processes for predictor data preprocessing. For the model with more time consuming in data preprocessing, the speedup can reach more than 50%.

11.2 New Features

- Support multi processes for predictor data preprocessing. (#272)
- Support STDC model. (#284) (#286)
- Support ReID and Multi-len MOT. (#285) (#295)
- Support STGCN model, and support export blade model. (#293) (#299)
- Add pose model zoo and support export torch jit and blade model for pose models. (#294)
- Support train motchallenge and crowdhuman datasets for detection models. (#265)

11.3 Improvements

- Speed up inference for face detector when using mtcnn. (#273)
- Add mobilenet config for itag and imagenet dataset, and optimize ClsSourceImageList api to support string label. (#276) (#283)
- Support multi-rows replacement for first order parameter. (#282)
- Add a tool to convert itag dataset to raw dataset. (#290)
- Add PoseTopDownPredictor to replace TorchPoseTopDownPredictorWithDetector (#296)

11.4 Bug Fixes

- Remove git lfs dependencies. ([#278](#))
- Fix wholebody keypoints evaluation. ([#287](#))
- Fix DetSourceRaw while label file and image file not match. ([#289](#))

V 0.9.0 (17/01/2023)

12.1 Highlights

- Support Single-lens MOT (#258)
- Support video recognition (X3D, SWIN-video) (#256)

12.2 New Features

- Add inception config and voc config for FCN and UperNet (#261)
- Add inference time under V100 for the benchmark of deitiii and hydra attention (#251)
- Add bev-blancheybrid benchmark (#249)

12.3 Improvements

- Optimize data source apis (#254)
- Update predict.py to support input model directory (#252)

12.4 Bug Fixes

- Fix MAE arg error after timm upgrade (#255)
- Fix export SSL models bug, avoid loading default pretrained backbone model (#257)
- Fix bug can't find config files while easycv is installed (#253)

13.1 Highlights

- Add BEVFormer and improve the performance of BEVFormer (#224)
- Add DINO++ and support objects365 pretrain (#242)

13.2 New Features

- Add DeiT of Hydra Attention version (#220)
- Add EdgeViTv3 (#214)
- Add BEVFormer and improve the performance of BEVFormer (#224)
- Add DINO++ and support objects365 pretrain (#242)

13.3 Improvements

- Unify the parsing method of config scripts, and support both local and pai platform products (#235)
- Add more data source apis for open source datasets, involving classification, detection, segmentation and key-points tasks. And part of the data source apis support automatic download. For more information, please refer to [data_hub](#) (#206 #229)
- Add confusion matrix metric for Classification models (#241)
- Add prediction script (#239)

13.4 Bug Fixes

- Sync the predict config in the config file for predictor (#238)
- Fix index of image_scale with y2 with bottom_left implemented in _mosaic_combine (#231)
- Add bevformer benchmark and fix classification predict bug (#240)

14.1 Highlights

- Support auto hyperparameter optimization of NNI (#211)
- Add DeiT III (#171)
- Add semantic segmentation model SegFormer (#191)
- Add 3d detection model BEVFormer (#203)

14.2 New Features

- Support semantic mask2former (#199)
- Support face 2d keypoint detection (#191)
- Support hand keypoints detection (#191)
- Support wholebody keypoint detection (#207)
- Support auto hyperparameter optimization of NNI (#211)
- Add DeiT III (#171)
- Add semantic segmentation model SegFormer (#191)
- Add 3d detection model BEVFormer (#203)

14.3 Improvements

- Optimize predictor apis, support cpu and batch inference (#195)
- Speed up ViTDet model (#177)
- Support export jit model end2end for yolox (#215)

14.4 Bug Fixes

- Fix the bug of io.copypart copying multiple directories (#193)
- Move thirdparty into easycv (#216)

V 0.6.1 (06/09/2022)

15.1 Bug Fixes

- Fix missing utils ([#183](#))

16.1 Highlights

- Release YOLOX-PAI which achieves SOTA results within 40~50 mAP (less than 1ms) (#154 #172 #174)
- Add detection algo DINO (#144)
- Add mask2former algo (#115)
- Releases imagenet1k, imagenet22k, coco, lvis, voc2012 data with BaiduDisk to accelerate downloading (#145)

16.2 New Features

- Add detection predictor which support model inference without exporting models(#158)
- Add VitDet support for faster-rcnn (#155)
- Release YOLOX-PAI which achieves SOTA results within 40~50 mAP (less than 1ms) (#154 #172 #174)
- Support DINO algo (#144)
- Add mask2former algo (#115)

16.3 Improvements

- FCOS update torch_style (#170)
- Add algo tables to describe which algo EasyCV support (#157)
- Refactor datasources api (#156 #140)
- Add PR and Issue template (#150)
- Update Fast ConvMAE doc (#151)

16.4 Bug Fixes

- Fix YOLOXlrUpdaterHook conflict with mmdet ([#169](#))
- Fix datasource cache problem([#153](#))

V 0.5.0 (28/07/2022)

17.1 Highlights

- Self-Supervised support ConvMAE algorithm ((#101) (#121))
- Classification support EfficientFormer algorithm (#128)
- Detection support FCOSDETRDAB-DETR and DN-DETR algorithm ((#100) (#104) (#119))
- Segmentation support UperNet algorithm (#118)
- Support use torchacc to speed up training (#105)

17.2 New Features

- Support use analyze tools (#133)

17.3 Bug Fixes

- Update yolox config template and fix bugs (#134)
- Fix yolox detector prediction export error (#125)
- Fix common_io url error (#126)

17.4 Improvements

- Add ViTDet visualization (#102)
- Refactor detection pipeline (#104)

V 0.4.0 (23/06/2022)

18.1 Highlights

- Add **semantic segmentation** modules, support FCN algorithm (#71)
- Expand classification model zoo (#55)
- Support export model with **blade** for yolox (#66)
- Support **ViTDet** algorithm (#35)
- Add sailfish for extensible fully sharded data parallel training (#97)
- Support run with **mmdetection** models (#25)

18.2 New Features

- Set multiprocessing env for speedup (#77)
- Add data hub, summarized various datasets in different fields (#70)

18.3 Bug Fixes

- Fix the inaccurate accuracy caused by missing the `groundtruth_is_crowd` field in CocoMaskEvaluator (#61)
- Unified the usage of pretrained parameter and fix load bugs(#79) (#85) (#95)

18.4 Improvements

- Update MAE pretrained models and benchmark (#50)
- Add detection benchmark for SwAV and MoCo-v2 (#58)
- Add moby swin-tiny pretrained model and benchmark (#72)
- Update prepare_data.md, add more details (#69)
- Optimize quantize code and support to export MNN model (#44)

V 0.3.0 (05/05/2022)

19.1 Highlights

- Support image visualization for tensorboard and wandb (#15)

19.2 New Features

- Update moby pretrained model to deit small (#10)
- Support image visualization for tensorboard and wandb (#15)
- Add mae vit-large benchmark and pretrained models (#24)

19.3 Bug Fixes

- Fix extract.py for benchmarks (#7)
- Fix inference error of classifier (#19)
- Fix multi-process reading of detection datasource and accelerate data preprocessing (#23)
- Fix torchvision transforms wrapper (#31)

19.4 Improvements

- Add chinese readme (#39)
- Add model compression tutorial (#20)
- Add notebook tutorials (#22)
- Uniform input and output format for transforms (#6)
- Update model zoo link (#8)
- Support readthedocs (#29)
- refine autorelease gitworkflow (#13)

V 0.2.2 (07/04/2022)

- initial commit & first release

1. SOTA SSL Algorithms

EasyCV provides state-of-the-art algorithms in self-supervised learning based on contrastive learning such as SimCLR, MoCO V2, Swav, DINO and also MAE based on masked image modeling. We also provides standard benchmark tools for ssl model evaluation.

1. Vision Transformers

EasyCV aims to provide plenty vision transformer models trained either using supervised learning or self-supervised learning, such as ViT, Swin-Transformer and Xcit. More models will be added in the future.

1. Functionality & Extensibility

In addition to SSL, EasyCV also support image classification, object detection, metric learning, and more area will be supported in the future. Although converging different area, EasyCV decompose the framework into different componets such as dataset, model, running hook, making it easy to add new componets and combining it with existing modules. EasyCV provide simple and comprehensive interface for inference. Additionally, all models are supported on PAI-EAS, which can be easily deployed as online service and support automatic scaling and service moniting.

1. Efficiency

EasyCV support multi-gpu and multi worker training. EasyCV use DALI to accelerate data io and preprocessing process, and use fp16 to accelerate training process. For inference optimization, EasyCV export model using jit script, which can be optimized by PAI-Blade.

EASYCV.APIS PACKAGE

21.1 Submodules

21.2 easycv.apis.export module

`easycv.apis.export.export(cfg, ckpt_path, filename, model=None, **kwargs)`
export model for inference

Parameters

- **cfg** – Config object
- **ckpt_path** (*str*) – path to checkpoint file
- **filename** (*str*) – filename to save exported models
- **model** (*nn.module*) – model instance

class `easycv.apis.export.PreProcess(target_size: Tuple[int, int] = (640, 640), keep_ratio: bool = True)`
Bases: `object`

Process the data input to model.

Parameters

- **target_size** (*Tuple[int, int]*) – output spatial size.
- **keep_ratio** (*bool*) – Whether to keep the aspect ratio when resizing the image.

__init__ (*target_size: Tuple[int, int] = (640, 640), keep_ratio: bool = True*)
Initialize self. See `help(type(self))` for accurate signature.

class `easycv.apis.export.ModelExportWrapper(model, example_inputs, trace_model: bool = True)`
Bases: `torch.nn.modules.module.Module`

__init__ (*model, example_inputs, trace_model: bool = True*) → `None`
Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

trace_module (***kwargs*)

forward (*image*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

class `easycv.apis.export.ProcessExportWrapper`(*example_inputs*, *process_fn*: *Optional[Callable]* = *None*)

Bases: `torch.nn.modules.module.Module`

split the preprocess that can be wrapped as a preprocess jit model the preproprocess procedure cannot be optimized in an end2end blade model due to dynamic shape problem

__init__(*example_inputs*, *process_fn*: *Optional[Callable]* = *None*) → *None*

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

forward(*image*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

21.3 easycv.apis.test module

`easycv.apis.test.single_cpu_test`(*model*, *data_loader*, *mode*='test', *show*=False, *out_dir*=None, *show_score_thr*=0.3, ***kwargs*)

`easycv.apis.test.single_gpu_test`(*model*, *data_loader*, *mode*='test', *use_fp16*=False, ***kwargs*)
Test model with single.

This method tests model with single

Parameters

- **model** (*str*) – Model to be tested.
- **data_loader** (*nn.DataLoader*) – Pytorch data loader.
- **model** – mode for model to forward
- **use_fp16** – Use fp16 inference

Returns The prediction results.

Return type `list`

`easycv.apis.test.multi_gpu_test`(*model*, *data_loader*, *mode*='test', *tmpdir*=None, *gpu_collect*=False, *use_fp16*=False, ***kwargs*)

Test model with multiple gpus.

This method tests model with multiple gpus and collects the results under two different modes: `gpu` and `cpu` modes. By setting '`gpu_collect=True`' it encodes results to `gpu` tensors and use `gpu` communication for results collection. On `cpu` mode it saves the results on different gpus to '`tmpdir`' and collects them by the rank 0 worker.

Parameters

- **model** (*str*) – Model to be tested.
- **data_loader** (*nn.DataLoader*) – Pytorch data loader.
- **model** – mode for model to forward
- **tmpdir** (*str*) – Path of directory to save the temporary results from different gpus under cpu mode.
- **gpu_collect** (*bool*) – Option to use either gpu or cpu to collect results.
- **use_fp16** – Use fp16 inference

Returns The prediction results.

Return type list

```
easycv.apis.test.collect_results_cpu(result_part, size, tmpdir=None)
```

```
easycv.apis.test.serialize_tensor(tensor_collection)
```

```
easycv.apis.test.collect_results_gpu(result_part, size)
```

21.4 easycv.apis.train module

```
easycv.apis.train.init_random_seed(seed=None, device='cuda')
```

Initialize random seed. If the seed is not set, the seed will be automatically randomized, and then broadcast to all processes to prevent some potential bugs. :param seed: The seed. Default to None. :type seed: int, Optional :param device: The device where the seed will be put on.

Default to 'cuda'.

Returns Seed to be used.

Return type int

```
easycv.apis.train.set_random_seed(seed, deterministic=False)
```

Set random seed.

Parameters

- **seed** (*int*) – Seed to be used.
- **deterministic** (*bool*) – Whether to set the deterministic option for CUDNN backend, i.e., set `torch.backends.cudnn.deterministic` to True and `torch.backends.cudnn.benchmark` to False. Default: False.

```
easycv.apis.train.train_model(model, data_loaders, cfg, distributed=False, timestamp=None, meta=None, use_fp16=False, validate=True, gpu_collect=True)
```

Training API.

Parameters

- **model** (*nn.Module*) – user defined model
- **data_loaders** – a list of dataloader for training data
- **cfg** – config object
- **distributed** – distributed training or not
- **timestamp** – time str formatted as '%Y%m%d_%H%M%S'

- **meta** – a dict containing meta data info, such as env_info, seed, iter, epoch
- **use_fp16** – use fp16 training or not
- **validate** – do evaluation while training
- **gpu_collect** – use gpu collect or cpu collect for tensor gathering

`easycv.apis.train.get_skip_list_keywords(model)`

`easycv.apis.train.build_optimizer(model, optimizer_cfg)`

Build optimizer from configs.

Parameters

- **model** (`nn.Module`) – The model with parameters to be optimized.
- **optimizer_cfg** (`dict`) – The config dict of the optimizer.

Positional fields are:

- type: class name of the optimizer.
- lr: base learning rate.

Optional fields are:

- any arguments of the corresponding optimizer type, e.g., `weight_decay`, `momentum`, etc.
- `paramwise_options`: a dict with regular expression as keys to match parameter names and a dict containing options as values. Options include 6 fields: `lr`, `lr_mult`, `momentum`, `momentum_mult`, `weight_decay`, `weight_decay_mult`.

Returns The initialized optimizer.

Return type `torch.optim.Optimizer`

Example

```
>>> model = torch.nn.modules.Conv1d(1, 1, 1)
>>> paramwise_options = {
>>>     '(bn|gn)(\d+)?.(weight|bias)': dict(weight_decay_mult=0.1),
>>>     '\Ahead.': dict(lr_mult=10, momentum=0)}
>>> optimizer_cfg = dict(type='SGD', lr=0.01, momentum=0.9,
>>>                       weight_decay=0.0001,
>>>                       paramwise_options=paramwise_options)
>>> optimizer = build_optimizer(model, optimizer_cfg)
```

21.5 easycv.apis.train_misc module

`easycv.apis.train_misc.build_yolo_optimizer(model, optimizer_cfg)`

build optimizer for yolo.

EASYCV.DATASETS PACKAGE

22.1 Subpackages

22.1.1 easycv.datasets.classification package

class `easycv.datasets.classification.ClsDataset(data_source, pipeline)`

Bases: `Generic[torch.utils.data.dataset.T_co]`

Dataset for classification

Parameters

- **data_source** – data source to parse input data
- **pipeline** – transforms list

__init__(*data_source*, *pipeline*)

Initialize self. See `help(type(self))` for accurate signature.

evaluate(*results*, *evaluators*, *logger=None*, *topk=(1, 5)*)

evaluate classification task

Parameters

- **results** – a dict of list of tensor, including prediction and groundtruth info, where prediction tensor is `NxC` and the same with groundtruth labels.
- **evaluators** – a list of evaluator

Returns a dict of float, different metric values

Return type `eval_result`

visualize(*results*, *vis_num=10*, ***kwargs*)

Visualize the model output on validation data. :param results: A dictionary containing

class: List of length number of test images. img metas: List of length number of test images, dict of image meta info, containing filename, img_shape, origin_img_shape and so on.

Parameters **vis_num** – number of images visualized

Returns: A dictionary containing images: Visualized images, list of `np.ndarray`. img metas: List of length number of test images,

dict of image meta info, containing filename, img_shape, origin_img_shape and so on.

```
class easycv.datasets.classification.ClsOddsDataset(data_source, pipeline, image_key='url_image',
                                                    label_key='label', **kwargs)
    Bases: Generic[torch.utils.data.dataset.T_co]
    Dataset for rotation prediction
    __init__(data_source, pipeline, image_key='url_image', label_key='label', **kwargs)
        Initialize self. See help(type(self)) for accurate signature.
    evaluate(results, evaluators, logger=None)
```

Subpackages

easycv.datasets.classification.data_sources package

```
class easycv.datasets.classification.data_sources.ClsSourceCifar10(root, split, download=True)
    Bases: object
    CLASSES = ['airplane', 'automobile', 'bird', 'cat', 'deer', 'dog', 'frog', 'horse',
               'ship', 'truck']
    __init__(root, split, download=True)
        Initialize self. See help(type(self)) for accurate signature.
```

```
class easycv.datasets.classification.data_sources.ClsSourceCifar100(root, split, download=True)
    Bases: object
    CLASSES = None
    __init__(root, split, download=True)
        Initialize self. See help(type(self)) for accurate signature.
```

```
class easycv.datasets.classification.data_sources.ClsSourceImageListByClass(root, list_file,
                                                                              m_per_class=2,
                                                                              delimiter=',',
                                                                              split_huge_listfile_byrank=False,
                                                                              cache_path='data',
                                                                              max_try=20)
    Bases: object
    Get the same m_per_class samples by the label idx.
```

Parameters

- **list_file** – str / list(str), str means a input image list file path, this file contains records as *image_path label* in list_file list(str) means multi image list, each one contains some records as *image_path label*
- **root** – str / list(str), root path for image_path, each list_file will need a root.
- **m_per_class** – num of samples for each class.
- **delimiter** – str, delimiter of each line in the *list_file*
- **split_huge_listfile_byrank** – Adapt to the situation that the memory cannot fully load a huge amount of data list. If split, data list will be split to each rank.
- **cache_path** – if *split_huge_listfile_byrank* is true, cache list_file will be saved to cache_path.
- **max_try** – int, max try numbers of reading image

```
__init__(root, list_file, m_per_class=2, delimiter=' ', split_huge_listfile_byrank=False, cache_path='data',
         max_try=20)
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.classification.data_sources.ClsSourceImageList(list_file, root="",
                                                                    delimiter=' ',
                                                                    split_huge_listfile_byrank=False,
                                                                    split_label_balance=False,
                                                                    cache_path='data',
                                                                    class_list=None)
```

Bases: object

data source for classification :param list_file: str / list(str), str means a input image list file path,

this file contains records as *image_path label* in list_file list(str) means multi image list, each one contains some records as *image_path label*

Parameters

- **root** – str / list(str), root path for image_path, each list_file will need a root, if len(root) < len(list_file), we will use root[-1] to fill root list.
- **delimiter** – str, delimiter of each line in the *list_file*
- **split_huge_listfile_byrank** – Adapt to the situation that the memory cannot fully load a huge amount of data list. If split, data list will be split to each rank.
- **split_label_balance** – if *split_huge_listfile_byrank* is true, whether split with label balance
- **cache_path** – if *split_huge_listfile_byrank* is true, cache list_file will be saved to cache_path.

```
__init__(list_file, root="", delimiter=' ', split_huge_listfile_byrank=False, split_label_balance=False,
         cache_path='data', class_list=None)
```

```

Bases: object

Random augmentation. This data augmentation is proposed in [RandAugment: Practical automated data augmentation with a reduced search space](#). :param policies: The policies of random augmentation. Each

policy in `policies` is one specific augmentation policy (dict). The policy shall at least have key `type`, indicating the type of augmentation. For those which have magnitude, (given to the fact they are named differently in different augmentation,) `magnitude_key` and `magnitude_range` shall be the magnitude argument (str) and the range of magnitude (tuple in the format of (val1, val2)), respectively. Note that val1 is not necessarily less than val2.

Parameters

- **num_policies** (*int*) – Number of policies to select from policies each time.
- **magnitude_level** (*int* | *float*) – Magnitude level for all the augmentation selected.
- **total_level** (*int* | *float*) – Total level for the magnitude. Defaults to 30.
- **magnitude_std** (*Number* | *str*) – Deviation of magnitude noise applied. - If positive number, magnitude is sampled from normal distribution

(mean=magnitude, std=magnitude_std).

- If 0 or negative number, magnitude remains unchanged.
 - If str “inf”, magnitude is sampled from uniform distribution (range=[min, magnitude]).
- **hparams** (*dict*) – Configs of hyperparameters. Hyperparameters will be used in policies that require these arguments if these arguments are not set in policy dicts. Defaults to use `_HPARAMS_DEFAULT`.

Note: *magnitude_std* will introduce some randomness to policy, modified by <https://github.com/rwightman/pytorch-image-models>. When *magnitude_std*=0, we calculate the magnitude as follows: .. math:

$$\text{magnitude} = \frac{\text{magnitude_level}}{\text{total_level}} \times (\text{val2} - \text{val1}) + \text{val1}$$

```
__init__(num_policies, magnitude_level, magnitude_std=0.0, total_level=30, policies=[{'type':
    'AutoContrast'}, {'type': 'Equalize'}, {'type': 'Invert'}, {'type': 'Rotate', 'magnitude_key': 'angle',
    'magnitude_range': (0, 30)}, {'type': 'Posterize', 'magnitude_key': 'bits', 'magnitude_range': (4, 0)},
    {'type': 'Solarize', 'magnitude_key': 'thr', 'magnitude_range': (256, 0)}, {'type': 'SolarizeAdd',
    'magnitude_key': 'magnitude', 'magnitude_range': (0, 110)}, {'type': 'ColorTransform',
    'magnitude_key': 'magnitude', 'magnitude_range': (0, 0.9)}, {'type': 'Contrast', 'magnitude_key':
    'magnitude', 'magnitude_range': (0, 0.9)}, {'type': 'Brightness', 'magnitude_key': 'magnitude',
    'magnitude_range': (0, 0.9)}, {'type': 'Sharpness', 'magnitude_key': 'magnitude',
    'magnitude_range': (0, 0.9)}, {'type': 'Shear', 'magnitude_key': 'magnitude', 'magnitude_range': (0,
    0.3), 'direction': 'horizontal'}, {'type': 'Shear', 'magnitude_key': 'magnitude', 'magnitude_range':
    (0, 0.3), 'direction': 'vertical'}, {'type': 'Translate', 'magnitude_key': 'magnitude',
    'magnitude_range': (0, 0.45), 'direction': 'horizontal'}, {'type': 'Translate', 'magnitude_key':
    'magnitude', 'magnitude_range': (0, 0.45), 'direction': 'vertical'}], hparams={'pad_val': 128})
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.classification.pipelines.MMRandomErasing(erase_prob=0.5,
    min_area_ratio=0.02,
    max_area_ratio=0.4,
    aspect_range=(0.3,
    3.3333333333333335),
    mode='const', fill_color=(128,
    128, 128), fill_std=None)
```

Bases: object

Randomly selects a rectangle region in an image and erase pixels. :param erase_prob: Probability that image will be randomly erased.

Default: 0.5

Parameters

- **min_area_ratio** (*float*) – Minimum erased area / input image area Default: 0.02
- **max_area_ratio** (*float*) – Maximum erased area / input image area Default: 0.4
- **aspect_range** (*sequence | float*) – Aspect ratio range of erased area. if float, it will be converted to (aspect_ratio, 1/aspect_ratio) Default: (3/10, 10/3)

- **mode** (*str*) – Fill method in erased area, can be: - const (default): All pixels are assign with the same value. - rand: each pixel is assigned with a random value in [0, 255]
- **fill_color** (*sequence / Number*) – Base color filled in erased area. Defaults to (128, 128, 128).
- **fill_std** (*sequence / Number, optional*) – If set and mode is 'rand', fill erased area with random color from normal distribution (mean=fill_color, std=fill_std); If not set, fill erased area with random color from uniform distribution (0~255). Defaults to None.

Note: See [Random Erasing Data Augmentation](#) This paper provided 4 modes: RE-R, RE-M, RE-0, RE-255, and use RE-M as default. The config of these 4 modes are: - RE-R: RandomErasing(mode='rand') - RE-M: RandomErasing(mode='const', fill_color=(123.67, 116.3, 103.5)) - RE-0: RandomErasing(mode='const', fill_color=0) - RE-255: RandomErasing(mode='const', fill_color=255)

__init__ (*erase_prob=0.5, min_area_ratio=0.02, max_area_ratio=0.4, aspect_range=(0.3, 3.3333333333333335), mode='const', fill_color=(128, 128, 128), fill_std=None*)
Initialize self. See help(type(self)) for accurate signature.

Submodules

`easycv.datasets.classification.pipelines.auto_augment` module

`easycv.datasets.classification.pipelines.auto_augment.random_negative` (*value, random_negative_prob*)

Randomly negate value based on random_negative_prob.

`easycv.datasets.classification.pipelines.auto_augment.merge_hparams` (*policy: dict, hparams: dict*)
Merge hyperparameters into policy config. Only merge partial hyperparameters required of the policy. :param policy: Original policy config dict. :type policy: dict :param hparams: Hyperparameters need to be merged. :type hparams: dict

Returns Policy config dict after adding hparams.

Return type dict

```

Auto augmentation. This data augmentation is proposed in [AutoAugment: Learning Augmentation Policies from Data](#). :param policies: The policies of auto augmentation. Each

policy in `policies` is a specific augmentation policy, and is composed by several augmentations (dict). When AutoAugment is called, a random policy in `policies` will be selected to augment images.

Parameters `hparams` (dict) – Configs of hyperparameters. Hyperparameters will be used in policies that require these arguments if these arguments are not set in policy dicts. Defaults to use `_HPARAMS_DEFAULT`.

```
__init__(policies=[[{'type': 'Posterize', 'bits': 4, 'prob': 0.4}, {'type': 'Rotate', 'angle': 30.0, 'prob': 0.6}],

                                                            (0, 0.3), 'direction':
                                                            'vertical'},
```

Random augmentation. This data augmentation is proposed in [RandAugment: Practical automated data augmentation with a reduced search space](#). :param policies: The policies of random augmentation. Each

policy in `policies` is one specific augmentation policy (dict). The policy shall at least have key `type`, indicating the type of augmentation. For those which have magnitude, (given to the fact they are named differently in different augmentation,) `magnitude_key` and `magnitude_range` shall be the magnitude argument (str) and the range of magnitude (tuple in the format of (val1, val2)), respectively. Note that val1 is not necessarily less than val2.

Parameters

- **num_policies** (*int*) – Number of policies to select from policies each time.
- **magnitude_level** (*int* | *float*) – Magnitude level for all the augmentation selected.
- **total_level** (*int* | *float*) – Total level for the magnitude. Defaults to 30.
- **magnitude_std** (*Number* | *str*) – Deviation of magnitude noise applied. - If positive number, magnitude is sampled from normal distribution
(mean=magnitude, std=magnitude_std).
 - If 0 or negative number, magnitude remains unchanged.
 - If str “inf”, magnitude is sampled from uniform distribution (range=[min, magnitude]).
- **hparams** (*dict*) – Configs of hyperparameters. Hyperparameters will be used in policies that require these arguments if these arguments are not set in policy dicts. Defaults to use `_HPARAMS_DEFAULT`.

Note: `magnitude_std` will introduce some randomness to policy, modified by <https://github.com/rwightman/pytorch-image-models>. When `magnitude_std=0`, we calculate the magnitude as follows: .. math:

$$\text{magnitude} = \frac{\text{magnitude_level}}{\text{total_level}} \times (\text{val2} - \text{val1}) + \text{val1}$$

```
__init__(num_policies, magnitude_level, magnitude_std=0.0, total_level=30, policies=[{'type':
'AutoContrast'}, {'type': 'Equalize'}, {'type': 'Invert'}, {'type': 'Rotate', 'magnitude_key': 'angle',
'magnitude_range': (0, 30)}, {'type': 'Posterize', 'magnitude_key': 'bits', 'magnitude_range': (4, 0)},
{'type': 'Solarize', 'magnitude_key': 'thr', 'magnitude_range': (256, 0)}, {'type': 'SolarizeAdd',
'magnitude_key': 'magnitude', 'magnitude_range': (0, 110)}, {'type': 'ColorTransform',

```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.classification.pipelines.auto_augment.Shear(magnitude, pad_val=128,
                                                                prob=0.5,
                                                                direction='horizontal',
                                                                random_negative_prob=0.5,
                                                                interpolation='bicubic')
```

Bases: object

Shear images. :param magnitude: The magnitude used for shear. :type magnitude: int | float :param pad_val: Pixel pad_val value for constant fill.

If a sequence of length 3, it is used to pad_val R, G, B channels respectively. Defaults to 128.

Parameters

- **prob** (*float*) – The probability for performing Shear therefore should be in range [0, 1]. Defaults to 0.5.
- **direction** (*str*) – The shearing direction. Options are ‘horizontal’ and ‘vertical’. Defaults to ‘horizontal’.
- **random_negative_prob** (*float*) – The probability that turns the magnitude negative, which should be in range [0,1]. Defaults to 0.5.
- **interpolation** (*str*) – Interpolation method. Options are ‘nearest’, ‘bilinear’, ‘bicubic’, ‘area’, ‘lanczos’. Defaults to ‘bicubic’.

```
__init__(magnitude, pad_val=128, prob=0.5, direction='horizontal', random_negative_prob=0.5,
        interpolation='bicubic')
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.classification.pipelines.auto_augment.Translate(magnitude,
                                                                    pad_val=128, prob=0.5,
                                                                    direction='horizontal',
                                                                    ran-
                                                                    dom_negative_prob=0.5,
                                                                    interpolation='nearest')
```

Bases: object

Translate images. :param magnitude: The magnitude used for translate. Note that

the offset is calculated by magnitude * size in the corresponding direction. With a magnitude of 1, the whole image will be moved out of the range.

Parameters

- **pad_val** (*int*, *Sequence[int]*) – Pixel pad_val value for constant fill. If a sequence of length 3, it is used to pad_val R, G, B channels respectively. Defaults to 128.
- **prob** (*float*) – The probability for performing translate therefore should be in range [0, 1]. Defaults to 0.5.
- **direction** (*str*) – The translating direction. Options are ‘horizontal’ and ‘vertical’. Defaults to ‘horizontal’.
- **random_negative_prob** (*float*) – The probability that turns the magnitude negative, which should be in range [0,1]. Defaults to 0.5.
- **interpolation** (*str*) – Interpolation method. Options are ‘nearest’, ‘bilinear’, ‘bicubic’, ‘area’, ‘lanczos’. Defaults to ‘nearest’.

```
__init__(magnitude, pad_val=128, prob=0.5, direction='horizontal', random_negative_prob=0.5, interpolation='nearest')
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.classification.pipelines.auto_augment.Rotate(angle, center=None, scale=1.0, pad_val=128, prob=0.5, random_negative_prob=0.5, interpolation='nearest')
```

Bases: object

Rotate images. :param angle: The angle used for rotate. Positive values stand for clockwise rotation.

Parameters

- **center** (*tuple[float], optional*) – Center point (w, h) of the rotation in the source image. If None, the center of the image will be used. Defaults to None.
- **scale** (*float*) – Isotropic scale factor. Defaults to 1.0.
- **pad_val** (*int, Sequence[int]*) – Pixel pad_val value for constant fill. If a sequence of length 3, it is used to pad_val R, G, B channels respectively. Defaults to 128.
- **prob** (*float*) – The probability for performing Rotate therefore should be in range [0, 1]. Defaults to 0.5.
- **random_negative_prob** (*float*) – The probability that turns the angle negative, which should be in range [0,1]. Defaults to 0.5.
- **interpolation** (*str*) – Interpolation method. Options are 'nearest', 'bilinear', 'bicubic', 'area', 'lanczos'. Defaults to 'nearest'.

```
__init__(angle, center=None, scale=1.0, pad_val=128, prob=0.5, random_negative_prob=0.5, interpolation='nearest')
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.classification.pipelines.auto_augment.AutoContrast(prob=0.5)
```

Bases: object

Auto adjust image contrast. :param prob: The probability for performing invert therefore should be in range [0, 1]. Defaults to 0.5.

```
__init__(prob=0.5)
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.classification.pipelines.auto_augment.Invert(prob=0.5)
```

Bases: object

Invert images. :param prob: The probability for performing invert therefore should be in range [0, 1]. Defaults to 0.5.

```
__init__(prob=0.5)
```

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.classification.pipelines.auto_augment.**Equalize**(*prob=0.5*)

Bases: object

Equalize the image histogram. :param prob: The probability for performing invert therefore should be in range [0, 1]. Defaults to 0.5.

__init__(*prob=0.5*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.classification.pipelines.auto_augment.**Solarize**(*thr, prob=0.5*)

Bases: object

Solarize images (invert all pixel values above a threshold). :param thr: The threshold above which the pixels value will be inverted.

Parameters **prob** (*float*) – The probability for solarizing therefore should be in range [0, 1]. Defaults to 0.5.

__init__(*thr, prob=0.5*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.classification.pipelines.auto_augment.**SolarizeAdd**(*magnitude, thr=128, prob=0.5*)

Bases: object

SolarizeAdd images (add a certain value to pixels below a threshold). :param magnitude: The value to be added to pixels below the thr. :type magnitude: int | float :param thr: The threshold below which the pixels value will be

adjusted.

Parameters **prob** (*float*) – The probability for solarizing therefore should be in range [0, 1]. Defaults to 0.5.

__init__(*magnitude, thr=128, prob=0.5*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.classification.pipelines.auto_augment.**Posterize**(*bits, prob=0.5*)

Bases: object

Posterize images (reduce the number of bits for each color channel). :param bits: Number of bits for each pixel in the output img,

which should be less or equal to 8.

Parameters **prob** (*float*) – The probability for posterizing therefore should be in range [0, 1]. Defaults to 0.5.

__init__(*bits, prob=0.5*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.classification.pipelines.auto_augment.**Contrast**(*magnitude, prob=0.5, random_negative_prob=0.5*)

Bases: object

Adjust images contrast. :param magnitude: The magnitude used for adjusting contrast. A

positive magnitude would enhance the contrast and a negative magnitude would make the image grayer. A magnitude=0 gives the origin img.

Parameters

- **prob** (*float*) – The probability for performing contrast adjusting therefore should be in range [0, 1]. Defaults to 0.5.
- **random_negative_prob** (*float*) – The probability that turns the magnitude negative, which should be in range [0,1]. Defaults to 0.5.

__init__ (*magnitude, prob=0.5, random_negative_prob=0.5*)
Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.classification.pipelines.auto_augment.**ColorTransform** (*magnitude, prob=0.5, random_negative_prob=0.5*)

Bases: object

Adjust images color balance. :param magnitude: The magnitude used for color transform. A

positive magnitude would enhance the color and a negative magnitude would make the image grayer. A magnitude=0 gives the origin img.

Parameters

- **prob** (*float*) – The probability for performing ColorTransform therefore should be in range [0, 1]. Defaults to 0.5.
- **random_negative_prob** (*float*) – The probability that turns the magnitude negative, which should be in range [0,1]. Defaults to 0.5.

__init__ (*magnitude, prob=0.5, random_negative_prob=0.5*)
Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.classification.pipelines.auto_augment.**Brightness** (*magnitude, prob=0.5, random_negative_prob=0.5*)

Bases: object

Adjust images brightness. :param magnitude: The magnitude used for adjusting brightness. A

positive magnitude would enhance the brightness and a negative magnitude would make the image darker. A magnitude=0 gives the origin img.

Parameters

- **prob** (*float*) – The probability for performing contrast adjusting therefore should be in range [0, 1]. Defaults to 0.5.
- **random_negative_prob** (*float*) – The probability that turns the magnitude negative, which should be in range [0,1]. Defaults to 0.5.

__init__ (*magnitude, prob=0.5, random_negative_prob=0.5*)
Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.classification.pipelines.auto_augment.Sharpness(magnitude, prob=0.5,
                                                                    ran-
                                                                    dom_negative_prob=0.5)
```

Bases: object

Adjust images sharpness. :param magnitude: The magnitude used for adjusting sharpness. A

positive magnitude would enhance the sharpness and a negative magnitude would make the image bulr. A magnitude=0 gives the origin img.

Parameters

- **prob** (*float*) – The probability for performing contrast adjusting therefore should be in range [0, 1]. Defaults to 0.5.
- **random_negative_prob** (*float*) – The probability that turns the magnitude negative, which should be in range [0,1]. Defaults to 0.5.

```
__init__(magnitude, prob=0.5, random_negative_prob=0.5)
Initialize self. See help(type(self)) for accurate signature.
```

```
class easycv.datasets.classification.pipelines.auto_augment.Cutout(shape, pad_val=128,
                                                                    prob=0.5)
```

Bases: object

Cutout images. :param shape: Expected cutout shape (h, w).

If given as a single value, the value will be used for both h and w.

Parameters

- **pad_val** (*int*, *Sequence[int]*) – Pixel pad_val value for constant fill. If it is a sequence, it must have the same length with the image channels. Defaults to 128.
- **prob** (*float*) – The probability for performing cutout therefore should be in range [0, 1]. Defaults to 0.5.

```
__init__(shape, pad_val=128, prob=0.5)
Initialize self. See help(type(self)) for accurate signature.
```

```
class easycv.datasets.classification.pipelines.auto_augment.PILGaussianBlur(prob=0.1,
                                                                    radius_min=0.1,
                                                                    ra-
                                                                    dius_max=2.0)
```

Bases: object

```
__init__(prob=0.1, radius_min=0.1, radius_max=2.0)
Initialize self. See help(type(self)) for accurate signature.
```

easycv.datasets.classification.pipelines.transform module

```
class easycv.datasets.classification.pipelines.transform.MMRandomErasing(erase_prob=0.5,  
                                                                    min_area_ratio=0.02,  
                                                                    max_area_ratio=0.4,  
                                                                    aspect_range=(0.3,  
                                                                    3.3333333333333335),  
                                                                    mode='const',  
                                                                    fill_color=(128, 128,  
                                                                    128), fill_std=None)
```

Bases: object

Randomly selects a rectangle region in an image and erase pixels. :param *erase_prob*: Probability that image will be randomly erased.

Default: 0.5

Parameters

- **min_area_ratio** (*float*) – Minimum erased area / input image area Default: 0.02
- **max_area_ratio** (*float*) – Maximum erased area / input image area Default: 0.4
- **aspect_range** (*sequence / float*) – Aspect ratio range of erased area. if float, it will be converted to (*aspect_ratio*, *1/aspect_ratio*) Default: (3/10, 10/3)
- **mode** (*str*) – Fill method in erased area, can be: - *const* (default): All pixels are assign with the same value. - *rand*: each pixel is assigned with a random value in [0, 255]
- **fill_color** (*sequence / Number*) – Base color filled in erased area. Defaults to (128, 128, 128).
- **fill_std** (*sequence / Number, optional*) – If set and mode is 'rand', fill erased area with random color from normal distribution (mean=*fill_color*, std=*fill_std*); If not set, fill erased area with random color from uniform distribution (0~255). Defaults to None.

Note: See [Random Erasing Data Augmentation](#) This paper provided 4 modes: RE-R, RE-M, RE-0, RE-255, and use RE-M as default. The config of these 4 modes are: - RE-R: RandomErasing(mode='rand') - RE-M: RandomErasing(mode='const', fill_color=(123.67, 116.3, 103.5)) - RE-0: RandomErasing(mode='const', fill_color=0) - RE-255: RandomErasing(mode='const', fill_color=255)

```
__init__(erase_prob=0.5, min_area_ratio=0.02, max_area_ratio=0.4, aspect_range=(0.3,  
        3.3333333333333335), mode='const', fill_color=(128, 128, 128), fill_std=None)  
    Initialize self. See help(type(self)) for accurate signature.
```

Submodules

easycv.datasets.classification.odps module

```
class easycv.datasets.classification.odps.ClsOdpsDataset(data_source, pipeline,
                                                         image_key='url_image',
                                                         label_key='label', **kwargs)

Bases: Generic[torch.utils.data.dataset.T_co]

Dataset for rotation prediction

__init__(data_source, pipeline, image_key='url_image', label_key='label', **kwargs)
    Initialize self. See help(type(self)) for accurate signature.

evaluate(results, evaluators, logger=None)
```

easycv.datasets.classification.raw module

```
class easycv.datasets.classification.raw.ClsDataset(data_source, pipeline)
Bases: Generic[torch.utils.data.dataset.T_co]
```

Dataset for classification

Parameters

- **data_source** – data source to parse input data
- **pipeline** – transforms list

```
__init__(data_source, pipeline)
    Initialize self. See help(type(self)) for accurate signature.
```

```
evaluate(results, evaluators, logger=None, topk=(1, 5))
    evaluate classification task
```

Parameters

- **results** – a dict of list of tensor, including prediction and groundtruth info, where prediction tensor is NxCan and the same with groundtruth labels.
- **evaluators** – a list of evaluator

Returns a dict of float, different metric values

Return type eval_result

```
visualize(results, vis_num=10, **kwargs)
```

Visulaize the model output on validation data. :param results: A dictionary containing

class: List of length number of test images. img metas: List of length number of test images, dict of image meta info, containing filename, img_shape, origin_img_shape and so on.

Parameters **vis_num** – number of images visualized

Returns: A dictionary containing images: Visulaized images, list of np.ndarray. img metas: List of length number of test images, dict of image meta info, containing filename, img_shape, origin_img_shape and so on.

22.1.2 easycv.datasets.detection package

class easycv.datasets.detection.DetDataset(*data_source*, *pipeline*, *profiling=False*, *classes=None*)
 Bases: Generic[torch.utils.data.dataset.T_co]

Dataset for Detection

__init__(*data_source*, *pipeline*, *profiling=False*, *classes=None*)

Parameters

- **data_source** – Data_source config dict
- **pipeline** – Pipeline config list
- **profiling** – If set True, will print pipeline time
- **classes** – A list of class names, used in evaluation for result and groundtruth visualization

evaluate(*results*, *evaluators=None*, *logger=None*)

Evaluates the detection boxes. :param results: A dictionary containing

detection_boxes: List of length number of test images. Float32 numpy array of shape [num_boxes, 4] and format [ymin, xmin, ymax, xmax] in absolute image coordinates.

detection_scores: List of length number of test images, detection scores for the boxes, float32 numpy array of shape [num_boxes].

detection_classes: List of length number of test images, integer numpy array of shape [num_boxes] containing 1-indexed detection classes for the boxes.

img metas: List of length number of test images, dict of image meta info, containing filename, img_shape, origin_img_shape, scale_factor and so on.

Parameters evaluators – evaluators to calculate metric with results and groundtruth_dict

visualize(*results*, *vis_num=10*, *score_thr=0.3*, ***kwargs*)

Visualize the model output on validation data. :param results: A dictionary containing

detection_boxes: List of length number of test images. Float32 numpy array of shape [num_boxes, 4] and format [ymin, xmin, ymax, xmax] in absolute image coordinates.

detection_scores: List of length number of test images, detection scores for the boxes, float32 numpy array of shape [num_boxes].

detection_classes: List of length number of test images, integer numpy array of shape [num_boxes] containing 1-indexed detection classes for the boxes.

img metas: List of length number of test images, dict of image meta info, containing filename, img_shape, origin_img_shape, scale_factor and so on.

Parameters

- **vis_num** – number of images visualized
- **score_thr** – The threshold to filter box, boxes with scores greater than score_thr will be kept.

Returns: A dictionary containing images: Visualized images. img_metas: List of length number of test images,

dict of image meta info, containing filename, img_shape, origin_img_shape, scale_factor and so on.

```
class easycv.datasets.detection.DetImagesMixDataset(data_source, pipeline, dynamic_scale=None,  
                                                    skip_type_keys=None, profiling=False,  
                                                    classes=None, yolo_format=True,  
                                                    label_padding=True)
```

Bases: Generic[torch.utils.data.dataset.T_co]

A wrapper of multiple images mixed dataset.

Suitable for training on multiple images mixed data augmentation like mosaic and mixup. For the augmentation pipeline of mixed image data, the *get_indexes* method needs to be provided to obtain the image indexes, and you can set *skip_flags* to change the pipeline running process. At the same time, we provide the *dynamic_scale* parameter to dynamically change the output image size.

output boxes format: cx, cy, w, h

Parameters

- **data_source** (DetSourceCoco) – The dataset to be mixed.
- **pipeline** (*Sequence[dict]*) – Sequence of transform object or config dict to be composed.
- **dynamic_scale** (*tuple[int], optional*) – The image scale can be changed dynamically. Default to None.
- **skip_type_keys** (*list[str], optional*) – Sequence of type string to be skip pipeline. Default to None.
- **label_padding** – out labeling padding [N, 120, 5]

```
__init__(data_source, pipeline, dynamic_scale=None, skip_type_keys=None, profiling=False,  
         classes=None, yolo_format=True, label_padding=True)
```

Args: data_source: Data_source config dict pipeline: Pipeline config list profiling: If set True, will print pipeline time classes: A list of class names, used in evaluation for result and groundtruth visualization

```
update_skip_type_keys(skip_type_keys)
```

Update skip_type_keys. It is called by an external hook.

Parameters **skip_type_keys** (*list[str], optional*) – Sequence of type string to be skip pipeline.

```
update_dynamic_scale(dynamic_scale)
```

Update dynamic_scale. It is called by an external hook.

Parameters **dynamic_scale** (*tuple[int]*) – The image scale can be changed dynamically.

```
results2json(results, outfile_prefix)
```

Dump the detection results to a COCO style json file.

There are 3 types of results: proposals, bbox predictions, mask predictions, and they have different data types. This method will automatically recognize the type, and dump them to json files.

Parameters

- **results** (*list[list | tuple | ndarray]*) – Testing results of the dataset.
- **outfile_prefix** (*str*) – The filename prefix of the json files. If the prefix is “somepath/xxx”, the json files will be named “somepath/xxx.bbox.json”, “somepath/xxx.segm.json”, “somepath/xxx.proposal.json”.

Returns str]: Possible keys are “bbox”, “segm”, “proposal”, and values are corresponding filenames.

Return type dict[str

format_results(*results*, *jsonfile_prefix=None*, ***kwargs*)

Format the results to json (standard format for COCO evaluation).

Parameters

- **results** (*list[tuple | numpy.ndarray]*) – Testing results of the dataset.
- **jsonfile_prefix** (*str | None*) – The prefix of json files. It includes the file path and the prefix of filename, e.g., “a/b/prefix”. If not specified, a temp file will be created. Default: None.

Returns (*result_files*, *tmp_dir*), *result_files* is a dict containing the json filepaths, *tmp_dir* is the temporal directory created for saving json files when *jsonfile_prefix* is not specified.

Return type tuple

Subpackages

easycv.datasets.detection.data_sources package

```
class easycv.datasets.detection.data_sources.DetSourceCoco(ann_file, img_prefix, pipeline,
                                                         test_mode=False,
                                                         filter_empty_gt=False, classes=None,
                                                         iscrowd=False)
```

Bases: object

coco data source

```
__init__(ann_file, img_prefix, pipeline, test_mode=False, filter_empty_gt=False, classes=None,
         iscrowd=False)
```

Parameters

- **ann_file** – Path of annotation file.
- **img_prefix** – coco path prefix
- **test_mode** (*bool*, *optional*) – If set True, *self._filter_imgs* will not works.
- **filter_empty_gt** (*bool*, *optional*) – If set true, images without bounding boxes of the dataset’s classes will be filtered out. This option only works when *test_mode=False*, i.e., we never filter images during tests.
- **iscrowd** – when traing setted as False, when val setted as True

load_annotations(*ann_file*)

Load annotation from COCO style annotation file. :param *ann_file*: Path of annotation file. :type *ann_file*: str

Returns Annotation info from COCO api.

Return type list[dict]

get_ann_info(*idx*)

Get COCO annotation by index. :param *idx*: Index of data. :type *idx*: int

Returns Annotation info of specified index.

Return type dict

get_cat_ids(*idx*)

Get COCO category ids by index. :param *idx*: Index of data. :type *idx*: int

Returns All categories in the image of specified index.

Return type list[int]

xyxy2xywh(*bbox*)

Convert xyxy style bounding boxes to xywh style for COCO evaluation. :param *bbox*: The bounding boxes, shape (4,), in

xyxy order.

Returns The converted bounding boxes, in xywh order.

Return type list[float]

pre_pipeline(*results*)

Prepare results dict for pipeline.

prepare_train_img(*idx*)

Get training data and annotations after pipeline. :param *idx*: Index of data. :type *idx*: int

Returns Training data and annotation after pipeline with new keys introduced by pipeline.

Return type dict

```
class easycv.datasets.detection.data_sources.DetSourceCocoPanoptic(ann_file, pan_ann_file,  
                                                                img_prefix, seg_prefix,  
                                                                pipeline,  
                                                                outfile_prefix='test/test_pan',  
                                                                test_mode=False,  
                                                                filter_empty_gt=False,  
                                                                thing_classes=None,  
                                                                stuff_classes=None,  
                                                                iscrowd=False)
```

Bases: [easycv.datasets.detection.data_sources.coco.DetSourceCoco](#)

cocopanoptic data source

```
__init__(ann_file, pan_ann_file, img_prefix, seg_prefix, pipeline, outfile_prefix='test/test_pan',  
         test_mode=False, filter_empty_gt=False, thing_classes=None, stuff_classes=None,  
         iscrowd=False)
```

Parameters

- **ann_file** (*str*) – Path of coco detection annotation file
- **pan_ann_file** (*str*) – Path of coco panoptic annotation file
- **img_prefix** (*str*) – Path of image file
- **seg_prefix** (*str*) – Path of semantic image file
- **pipeline** (*list[dict]*) – list of data augmentatin operation
- **outfile_prefix** (*str*, *optional*) – The filename prefix of the output files. If the prefix is “somepath/xxx”, the json files will be named “somepath/xxx.panoptic.json”, “somepath/xxx.bbox.json”, “somepath/xxx.segm.json”
- **test_mode** (*bool*, *optional*) – If set True, *self._filter_imgs* will not works.

- **filter_empty_gt** (*bool, optional*) – If set true, images without bounding boxes of the dataset’s classes will be filtered out. This option only works when *test_mode=False*, i.e., we never filter images during tests.
- **thing_classes** (*list[str], optional*) – list of thing classes. Defaults to None.
- **stuff_classes** (*list[str], optional*) – list of thing classes. Defaults to None.
- **iscrowd** (*bool, optional*) – when training setted as False, when val setted as True. Defaults to False.

load_annotations_pan(*ann_file*)

Load annotation from COCO Panoptic style annotation file.

Parameters **ann_file** (*str*) – Path of annotation file.

Returns Annotation info from COCO api.

Return type list[dict]

get_ann_info_pan(*idx*)

Get COCO annotation by index.

Parameters **idx** (*int*) – Index of data.

Returns Annotation info of specified index.

Return type dict

pre_pipeline(*results*)

Prepare results dict for pipeline.

prepare_train_img(*idx*)

Get training data and annotations after pipeline.

Parameters **idx** (*int*) – Index of data.

Returns Training data and annotation after pipeline with new keys introduced by pipeline.

Return type dict

results2json(*results*)

Dump the results to a COCO style json file.

There are 4 types of results: proposals, bbox predictions, mask predictions, panoptic segmentation predictions, and they have different data types. This method will automatically recognize the type, and dump them to json files.

```
[
  {
    'pan_results': np.array, # shape (h, w)
    # ins_results which includes bboxes and RLE encoded masks
    # is optional.
    'ins_results': (list[np.array], list[list[str]])
  },
  ...
]
```

Parameters **results** (*list[dict]*) – Testing results of the dataset.

Returns str: Possible keys are “panoptic”, “bbox”, “segm”, “proposal”, and values are corresponding filenames.

Return type dict[str]

get_gt_json(*result_files*)

get input for coco panptic evaluation

Parameters **result_files** (*dict*) – path of predict result

Returns gt label gt_folder (str): path of gt file pred_json(dict): predict result pred_folder(str): path of pred file categories(dict): panoptic categories

Return type gt_json (dict)

class easycv.datasets.detection.data_sources.**DetSourceObjects365**(*ann_file, img_prefix, pipeline, test_mode=False, filter_empty_gt=False, classes=[], iscrowd=False*)

Bases: [easycv.datasets.detection.data_sources.coco.DetSourceCoco](#)

objects365 data source. The form of the objects365 dataset folder build:

| - objects365

| - annotation | - zhiyuan_objv2_train.json | - zhiyuan_objv2_val.json

| - train

| - patch0 | - *****(imageID)

| - patch1 | - *****(imageID)

... | - patch50

| - *****(imageID)

| - val

| - patch0 | - *****(imageID)

| - patch1 | - *****(imageID)

... | - patch43

| - *****(imageID)

__init__(*ann_file, img_prefix, pipeline, test_mode=False, filter_empty_gt=False, classes=[], iscrowd=False*)

Parameters

- **ann_file** – Path of annotation file.
- **img_prefix** – coco path prefix
- **test_mode** (*bool, optional*) – If set True, *self._filter_imgs* will not works.
- **filter_empty_gt** (*bool, optional*) – If set true, images without bounding boxes of the dataset's classes will be filtered out. This option only works when *test_mode=False*, i.e., we never filter images during tests.
- **iscrowd** – when traing setted as False, when val setted as True

load_annotations(*ann_file*)

Load annotation from COCO style annotation file. :param ann_file: Path of annotation file. :type ann_file: str

Returns Annotation info from COCO api.

Return type list[dict]

```
class easycv.datasets.detection.data_sources.DetSourcePAI(path, classes=[], cache_at_init=False,
                                                         cache_on_the_fly=False,
                                                         parse_fn=<function
                                                         parser_manifest_row_str>,
                                                         num_processes=1, **kwargs)
```

Bases: easycv.datasets.detection.data_sources.base.DetSourceBase

data format please refer to: https://help.aliyun.com/document_detail/311173.html

```
__init__(path, classes=[], cache_at_init=False, cache_on_the_fly=False, parse_fn=<function
        parser_manifest_row_str>, num_processes=1, **kwargs)
```

Parameters

- **path** – Path of manifest path with pai label format
- **classes** – classes list
- **cache_at_init** – if set True, will cache in memory in `__init__` for faster training
- **cache_on_the_fly** – if set True, will cache in memroy during training
- **parse_fn** – parse function to parse item of source iterator
- **num_processes** – number of processes to parse samples

get_source_iterator()

Return data list iterator, source iterator will be passed to `parse_fn`, and `parse_fn` will receive params of item of source iter and classes for parsing. What does `parse_fn` need, what does source iterator returns.

```
class easycv.datasets.detection.data_sources.DetSourceRaw(img_root_path, label_root_path,
                                                         classes=[], cache_at_init=False,
                                                         cache_on_the_fly=False, delimiter=' ',
                                                         parse_fn=<function parse_raw>,
                                                         num_processes=1, **kwargs)
```

Bases: easycv.datasets.detection.data_sources.base.DetSourceBase

data dir is as follows: ```` |- data_dir`

`|-images |-1.jpg |-...`

`|-labels |-1.txt |-...`

` Label txt file is as follows: The first column is the label id, and columns 2 to 5 are coordinates relative to the image width and height [x_center, y_center, bbox_w, bbox_h].` 15 0.519398 0.544087 0.476359 0.572061 2 0.501859 0.820726 0.996281 0.332178 ...
```` .. rubric:: Example`

```
data_source = DetSourceRaw(img_root_path='/your/data_dir/images', label_root_path='/your/data_dir/labels',

```

```
__init__(img_root_path, label_root_path, classes=[], cache_at_init=False, cache_on_the_fly=False,
 delimiter=' ', parse_fn=<function parse_raw>, num_processes=1, **kwargs)
```

#### Parameters

- **img\_root\_path** – images dir path
- **label\_root\_path** – labels dir path
- **classes** (*list, optional*) – classes list

- **cache\_at\_init** – if set True, will cache in memory in `__init__` for faster training
- **cache\_on\_the\_fly** – if set True, will cache in memroy during training
- **delimiter** – delimiter of txt file
- **parse\_fn** – parse function to parse item of source iterator
- **num\_processes** – number of processes to parse samples

**get\_source\_iterator()**

Return data list iterator, source iterator will be passed to `parse_fn`, and `parse_fn` will receive params of item of source iter and classes for parsing. What does `parse_fn` need, what does source iterator returns.

**post\_process\_fn(result\_dict)**

**get\_ann\_info(idx)**

Get raw annotation info, include bounding boxes, labels and so on. *bboxes* format is as [x1, y1, x2, y2] without normalization.

```
class easycv.datasets.detection.data_sources.DetSourceVOC(path, classes=[], img_root_path=None,
 label_root_path=None,
 cache_at_init=False,
 cache_on_the_fly=False,
 img_suffix='.jpg', label_suffix='.xml',
 parse_fn=<function parse_xml>,
 num_processes=1, **kwargs)
```

Bases: `easycv.datasets.detection.data_sources.base.DetSourceBase`

data dir is as follows: ```` |- voc_data`

`|-ImageSets`

`|-Main |-train.txt |-...`

`|-JPEGImages |-00001.jpg |-...`

`|-Annotations |-00001.xml |-...`

```` Example1:`

```
data_source = DetSourceVOC( path='/your/voc_data/ImageSets/Main/train.txt',
                             classes=${ VOC_CLASSES },
                             )
```

Example1:

```
data_source = DetSourceVOC( path='/your/voc_data/train.txt',           classes=${ VOC_CLASSES },
                             img_root_path='/your/voc_data/images', img_root_path='/your/voc_data/annotations'
                             )
```

```
__init__(path, classes=[], img_root_path=None, label_root_path=None, cache_at_init=False,
          cache_on_the_fly=False, img_suffix='.jpg', label_suffix='.xml', parse_fn=<function parse_xml>,
          num_processes=1, **kwargs)
```

Parameters

- **path** – path of img id list file in ImageSets/Main/
- **classes** – classes list

- **img_root_path** – image dir path, if None, default to detect the image dir by the relative path of the *path* according to the VOC data format.
- **label_root_path** – label dir path, if None, default to detect the label dir by the relative path of the *path* according to the VOC data format.
- **cache_at_init** – if set True, will cache in memory in `__init__` for faster training
- **cache_on_the_fly** – if set True, will cache in memroy during training
- **img_suffix** – suffix of image file
- **label_suffix** – suffix of label file
- **parse_fn** – parse function to parse item of source iterator
- **num_processes** – number of processes to parse samples

get_source_iterator()

Return data list iterator, source iterator will be passed to `parse_fn`, and `parse_fn` will receive params of item of source iter and classes for parsing. What does `parse_fn` need, what does source iterator returns.

```
class easycv.datasets.detection.data_sources.DetSourceVOC2007(path=None, download=True,

- **path** – path of img id list file in root
- **classes** – classes list
- **img_root_path** – image dir path, if None, default to detect the image dir by the relative path of the *path* according to the WiderPerso data format.
- **label_root_path** – label dir path, if None, default to detect the label dir by the relative path of the *path* according to the WiderPerso data format.
- **cache_at_init** – if set True, will cache in memory in `__init__` for faster training
- **cache_on_the_fly** – if set True, will cache in memroy during training
- **img_suffix** – suffix of image file
- **label_suffix** – suffix of label file
- **parse_fn** – parse function to parse item of source iterator
- **num_processes** – number of processes to parse samples

```
get_source_iterator()
```

Return data list iterator, source iterator will be passed to `parse_fn`, and `parse_fn` will receive params of item of source iter and classes for parsing. What does `parse_fn` need, what does source iterator returns.

```
class easycv.datasets.detection.data_sources.DetSourceAfricanWildlife(path, classes=['buffalo',
                                         'elephant', 'rhino',
                                         'zebra'],
                           cache_at_init=False,
                           cache_on_the_fly=False,
                           img_suffix='.jpg',
                           label_suffix='.txt',
                           parse_fn=<function
                           parse_txt>,
                           num_processes=1,
                           **kwargs)
```

Bases: `easycv.datasets.detection.data_sources.base.DetSourceBase`

data dir is as follows: ``|- data

```
|-buffalo |-001.jpg |-001.txt |-...
|-elephant |-001.jpg |-001.txt |-...
|-rhino |-001.jpg |-001.txt
|-...
```

`` Example1:

```
data_source = DetSourceAfricanWildlife( path='/your/data/', classes=${CLASSES},
)
```

```
CLASSES = ['buffalo', 'elephant', 'rhino', 'zebra']
```

```
__init__(path, classes=['buffalo', 'elephant', 'rhino', 'zebra'], cache_at_init=False, cache_on_the_fly=False,
         img_suffix='.jpg', label_suffix='.txt', parse_fn=<function parse_txt>, num_processes=1,
         **kwargs) → None
```

Parameters

- **path** – path of img id list file in root
- **classes** – classes list
- **cache_at_init** – if set True, will cache in memory in `__init__` for faster training
- **cache_on_the_fly** – if set True, will cache in memroy during training

        None
```

Parameters

- **ann_file** (*str*) – Path to the annotation file.
- **img_prefix** (*str*) – Path to a directory where images are held.
- **gt_op** (*str*) – vbox(visible box), fbox(full box), hbox(head box), default vbox
- **classes** (*list*) – classes default=['mask', 'person']
- **cache_at_init** – if set True, will cache in memory in **__init__** for faster training
- **cache_on_the_fly** – if set True, will cache in memory during training
- **parse_fn** – parse function to parse item of source iterator
- **num_processes** – number of processes to parse samples

get_source_iterator()

Return data list iterator, source iterator will be passed to **parse_fn**, and **parse_fn** will receive params of item of source iter and classes for parsing. What does **parse_fn** need, what does source iterator returns.

Submodules

easycv.datasets.detection.data_sources.coco module

```
class easycv.datasets.detection.data_sources.coco.DetSourceCoco(ann_file, img_prefix, pipeline,
                                                             test_mode=False,
                                                             filter_empty_gt=False,
                                                             classes=None, iscrowd=False)
```

Bases: object

coco data source

```
__init__(ann_file, img_prefix, pipeline, test_mode=False, filter_empty_gt=False, classes=None,
        iscrowd=False)
```

Parameters

- **ann_file** – Path of annotation file.
- **img_prefix** – coco path prefix
- **test_mode** (*bool*, *optional*) – If set True, *self.filter_imgs* will not works.
- **filter_empty_gt** (*bool*, *optional*) – If set true, images without bounding boxes of the dataset's classes will be filtered out. This option only works when *test_mode*=False, i.e., we never filter images during tests.
- **iscrowd** – when training setted as False, when val setted as True

load_annotations(*ann_file*)

Load annotation from COCO style annotation file. :param *ann_file*: Path of annotation file. :type *ann_file*: str

Returns Annotation info from COCO api.

Return type list[dict]

get_ann_info(*idx*)

Get COCO annotation by index. :param *idx*: Index of data. :type *idx*: int

Returns Annotation info of specified index.

Return type dict

get_cat_ids(*idx*)

Get COCO category ids by index. :param *idx*: Index of data. :type *idx*: int

Returns All categories in the image of specified index.

Return type list[int]

xyxy2xywh(*bbox*)

Convert xyxy style bounding boxes to xywh style for COCO evaluation. :param *bbox*: The bounding boxes, shape (4,), in

xyxy order.

Returns The converted bounding boxes, in xywh order.

Return type list[float]

pre_pipeline(*results*)

Prepare results dict for pipeline.

prepare_train_img(*idx*)

Get training data and annotations after pipeline. :param *idx*: Index of data. :type *idx*: int

Returns Training data and annotation after pipeline with new keys introduced by pipeline.

Return type dict

```
class easycv.datasets.detection.data_sources.coco.DetSourceCoco2017(pipeline, path=None,
                                                                    download=True,
                                                                    split='train',
                                                                    test_mode=False,
                                                                    filter_empty_gt=False,
                                                                    classes=None,
                                                                    iscrowd=False)
```

Bases: [easycv.datasets.detection.data_sources.coco.DetSourceCoco](#)

coco2017 data source

```
__init__(pipeline, path=None, download=True, split='train', test_mode=False, filter_empty_gt=False,
          classes=None, iscrowd=False)
```

Parameters

- **path** – This parameter is optional. If download is True and path is not provided, a temporary directory is automatically created for downloading
- **download** – If the value is True, the file is automatically downloaded to the path directory. If False, automatic download is not supported and data in the path is used
- **split** – train or val
- **test_mode** (*bool*, *optional*) – If set True, *self._filter_imgs* will not works.

- **filter_empty_gt** (*bool, optional*) – If set true, images without bounding boxes of the dataset's classes will be filtered out. This option only works when *test_mode=False*, i.e., we never filter images during tests.
- **iscrowd** – when training setted as False, when val setted as True

```

```

Bases: `easycv.datasets.detection.data_sources.base.DetSourceBase`

data dir is as follows: ```` |- data_dir`

`|-images |-1.jpg |-...`

`|-labels |-1.txt |-...`

` Label txt file is as follows: The first column is the label id, and columns 2 to 5 are coordinates relative to the image width and height [x_center, y_center, bbox_w, bbox_h]. ` 15 0.519398 0.544087 0.476359 0.572061 2 0.501859 0.820726 0.996281 0.332178 ...
```` .. rubric:: Example`

```
data_source = DetSourceRaw(img_root_path='/your/data_dir/images', label_root_path='/your/data_dir/labels',
)
```

```
__init__(img_root_path, label_root_path, classes=[], cache_at_init=False, cache_on_the_fly=False,
 delimiter='', parse_fn=<function parse_raw>, num_processes=1, **kwargs)
```

**Parameters**

- **img\_root\_path** – images dir path
- **label\_root\_path** – labels dir path
- **classes** (*list, optional*) – classes list
- **cache\_at\_init** – if set True, will cache in memory in `__init__` for faster training
- **cache\_on\_the\_fly** – if set True, will cache in memroy during training
- **delimiter** – delimiter of txt file
- **parse\_fn** – parse function to parse item of source iterator

- **num\_processes** – number of processes to parse samples

**get\_source\_iterator()**

Return data list iterator, source iterator will be passed to `parse_fn`, and `parse_fn` will receive params of item of source iter and classes for parsing. What does `parse_fn` need, what does source iterator returns.

**post\_process\_fn(result\_dict)****get\_ann\_info(idx)**

Get raw annotation info, include bounding boxes, labels and so on. *bboxes* format is as [x1, y1, x2, y2] without normalization.

**easycv.datasets.detection.data\_sources.utils module**

```
easycv.datasets.detection.data_sources.utils.exif_size(img)
```

**easycv.datasets.detection.data\_sources.voc module**

```
easycv.datasets.detection.data_sources.voc.parse_xml(source_item, classes)
```

```
class easycv.datasets.detection.data_sources.voc.DetSourceVOC(path, classes=[],
 img_root_path=None,
 label_root_path=None,
 cache_at_init=False,
 cache_on_the_fly=False,
 img_suffix='.jpg',
 label_suffix='.xml',
 parse_fn=<function parse_xml>,
 num_processes=1, **kwargs)
```

Bases: `easycv.datasets.detection.data_sources.base.DetSourceBase`

data dir is as follows: ``` |- voc\_data

    |-ImageSets

        |-Main |-train.txt |...

    |-JPEGImages |-00001.jpg |...

    |-Annotations |-00001.xml |...

``` Example1:

```
data_source = DetSourceVOC( path='/your/voc_data/ImageSets/Main/train.txt',
                             classes=${ VOC_CLASSES},
                             )
```

Example1:

```
data_source = DetSourceVOC( path='/your/voc_data/train.txt',          classes=${ VOC_CLASSES},
                             img_root_path='/your/voc_data/images', img_root_path='/your/voc_data/annotations'
                             )
```

```
__init__(path, classes=[], img_root_path=None, label_root_path=None, cache_at_init=False,
          cache_on_the_fly=False, img_suffix='.jpg', label_suffix='.xml', parse_fn=<function parse_xml>,
          num_processes=1, **kwargs)
```

Parameters

- **path** – path of img id list file in ImageSets/Main/
- **classes** – classes list
- **img_root_path** – image dir path, if None, default to detect the image dir by the relative path of the *path* according to the VOC data format.
- **label_root_path** – label dir path, if None, default to detect the label dir by the relative path of the *path* according to the VOC data format.
- **cache_at_init** – if set True, will cache in memory in `__init__` for faster training
- **cache_on_the_fly** – if set True, will cache in memroy during training
- **img_suffix** – suffix of image file
- **label_suffix** – suffix of label file
- **parse_fn** – parse function to parse item of source iterator
- **num_processes** – number of processes to parse samples

get_source_iterator()

Return data list iterator, source iterator will be passed to `parse_fn`, and `parse_fn` will receive params of item of source iter and classes for parsing. What does `parse_fn` need, what does source iterator returns.

```
class easycv.datasets.detection.data_sources.voc.DetSourceVOC2012(path=None, download=True,
                                                                split='train', classes=[],
                                                                img_root_path=None,
                                                                label_root_path=None,
                                                                cache_at_init=False,
                                                                cache_on_the_fly=False,
                                                                img_suffix='.jpg',
                                                                label_suffix='.xml',
                                                                parse_fn=<function
                                                                parse_xml>,
                                                                num_processes=1, **kwargs)
```

Bases: `easycv.datasets.detection.data_sources.voc.DetSourceVOC`

```

easycv.datasets.detection.pipelines package**class** easycv.datasets.detection.pipelines.**MMToTensor**

Bases: object

Transform image to Tensor. Required key: 'img'. Modifies key: 'img'. :param results: contain all information about training. :type results: dict

class easycv.datasets.detection.pipelines.**NormalizeTensor**(*mean, std*)

Bases: object

Normalize the Tensor image (CxHxW), with mean and std. Required key: 'img'. Modifies key: 'img'. :param mean: Mean values of 3 channels. :type mean: list[float] :param std: Std values of 3 channels. :type std: list[float]

__init__(*mean, std*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.detection.pipelines.**MMMosaic**(*img_scale=(640, 640), center_ratio_range=(0.5, 1.5), pad_val=114*)

Bases: object

Mosaic augmentation. Given 4 images, mosaic transform combines them into one output image. The output image is composed of the parts from each sub- image. .. code:: text

```

    mosaic transform  center_x

center_y |-----+-----+-----|
          | cropped ||
          | pad | image3 | image4 || || | +----|-----+-----+
          |

```

The mosaic transform steps are as follows:

1. Choose the mosaic center as the intersections of 4 images
2. Get the left top image according to the index, and randomly sample another 3 images from the custom dataset.
3. Sub image will be cropped if image is larger than mosaic patch

Parameters

- **img_scale** (*Sequence[int]*) – Image size after mosaic pipeline of single image. Default to (640, 640).
- **center_ratio_range** (*Sequence[float]*) – Center ratio range of mosaic output. Default to (0.5, 1.5).
- **pad_val** (*int*) – Pad value. Default to 114.

__init__(*img_scale=(640, 640), center_ratio_range=(0.5, 1.5), pad_val=114*)

Initialize self. See help(type(self)) for accurate signature.

get_indexes(*dataset*)

Call function to collect indexes. :param dataset: The dataset. :type dataset: DetImagesMixDataset

Returns indexes.

Return type list

```
class easycv.datasets.detection.pipelines.MMMixUp(img_scale=(640, 640), ratio_range=(0.5, 1.5),
                                                flip_ratio=0.5, pad_val=114, max_iters=15,
                                                min_bbox_size=5, min_area_ratio=0.2,
                                                max_aspect_ratio=20)
```

Bases: object

MixUp data augmentation. .. code:: text

mixup transform

The mixup transform steps are as follows::

1. Another random image is picked by dataset and embedded in the top left patch(after padding and resizing)
2. The target of mixup transform is the weighted average of mixup image and origin image.

Parameters

- **img_scale** (*Sequence[int]*) – Image output size after mixup pipeline. Default: (640, 640).
- **ratio_range** (*Sequence[float]*) – Scale ratio of mixup image. Default: (0.5, 1.5).
- **flip_ratio** (*float*) – Horizontal flip ratio of mixup image. Default: 0.5.
- **pad_val** (*int*) – Pad value. Default: 114.
- **max_iters** (*int*) – The maximum number of iterations. If the number of iterations is greater than *max_iters*, but *gt_bbox* is still empty, then the iteration is terminated. Default: 15.
- **min_bbox_size** (*float*) – Width and height threshold to filter bboxes. If the height or width of a box is smaller than this value, it will be removed. Default: 5.
- **min_area_ratio** (*float*) – Threshold of area ratio between original bboxes and wrapped bboxes. If smaller than this value, the box will be removed. Default: 0.2.
- **max_aspect_ratio** (*float*) – Aspect ratio of width and height threshold to filter bboxes. If $\max(h/w, w/h)$ larger than this value, the box will be removed. Default: 20.

```
__init__(img_scale=(640, 640), ratio_range=(0.5, 1.5), flip_ratio=0.5, pad_val=114, max_iters=15,
        min_bbox_size=5, min_area_ratio=0.2, max_aspect_ratio=20)
```

Initialize self. See help(type(self)) for accurate signature.

```
get_indexes(dataset)
```

Call function to collect indexes. :param dataset: The dataset. :type dataset: DetImagesMixDataset

Returns indexes.

Return type list

```
class easycv.datasets.detection.pipelines.MMRandomAffine(max_rotate_degree=10.0,
                                                         max_translate_ratio=0.1,
                                                         scaling_ratio_range=(0.5, 1.5),
                                                         max_shear_degree=2.0, border=(0, 0),
                                                         border_val=(114, 114, 114),
                                                         min_bbox_size=2, min_area_ratio=0.2,
                                                         max_aspect_ratio=20)
```

Bases: object

Random affine transform data augmentation. for yolox This operation randomly generates affine transform matrix which including rotation, translation, shear and scaling transforms. :param max_rotate_degree: Maximum degrees of rotation transform.

Default: 10.

Parameters

- **max_translate_ratio** (*float*) – Maximum ratio of translation. Default: 0.1.
- **scaling_ratio_range** (*tuple[*float*]*) – Min and max ratio of scaling transform. Default: (0.5, 1.5).
- **max_shear_degree** (*float*) – Maximum degrees of shear transform. Default: 2.
- **border** (*tuple[*int*]*) – Distance from height and width sides of input image to adjust output shape. Only used in mosaic dataset. Default: (0, 0).
- **border_val** (*tuple[*int*]*) – Border padding values of 3 channels. Default: (114, 114, 114).
- **min_bbox_size** (*float*) – Width and height threshold to filter bboxes. If the height or width of a box is smaller than this value, it will be removed. Default: 2.
- **min_area_ratio** (*float*) – Threshold of area ratio between original bboxes and wrapped bboxes. If smaller than this value, the box will be removed. Default: 0.2.
- **max_aspect_ratio** (*float*) – Aspect ratio of width and height threshold to filter bboxes. If max(h/w, w/h) larger than this value, the box will be removed.

```
__init__(max_rotate_degree=10.0, max_translate_ratio=0.1, scaling_ratio_range=(0.5, 1.5),
          max_shear_degree=2.0, border=(0, 0), border_val=(114, 114, 114), min_bbox_size=2,
          min_area_ratio=0.2, max_aspect_ratio=20)
```

Initialize self. See help(type(self)) for accurate signature.

```
filter_gt_bboxes(origin_bboxes, wrapped_bboxes)
```

```
class easycv.datasets.detection.pipelines.MMPhotoMetricDistortion(brightness_delta=32,
                                                                    contrast_range=(0.5, 1.5),
                                                                    saturation_range=(0.5, 1.5),
                                                                    hue_delta=18)
```

Bases: object

Apply photometric distortion to image sequentially, every transformation is applied with a probability of 0.5. The position of random contrast is in second or second to last. 1. random brightness 2. random contrast (mode 0) 3. convert color from BGR to HSV 4. random saturation 5. random hue 6. convert color from HSV to BGR 7.

random contrast (mode 1) 8. randomly swap channels :param brightness_delta: delta of brightness. :type brightness_delta: int :param contrast_range: range of contrast. :type contrast_range: tuple :param saturation_range: range of saturation. :type saturation_range: tuple :param hue_delta: delta of hue. :type hue_delta: int

__init__(brightness_delta=32, contrast_range=(0.5, 1.5), saturation_range=(0.5, 1.5), hue_delta=18)
Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.detection.pipelines.MMResize(img_scale=None, multiscale_mode='range', ratio_range=None, keep_ratio=True, bbox_clip_border=True, backend='cv2', override=False)

Bases: object

Resize images & bbox & mask. This transform resizes the input image to some scale. Bboxes and masks are then resized with the same scale factor. If the input dict contains the key “scale”, then the scale in the input dict is used, otherwise the specified scale in the init method is used. If the input dict contains the key “scale_factor” (if MultiScaleFlipAug does not give img_scale but scale_factor), the actual scale will be computed by image shape and scale_factor. *img_scale* can either be a tuple (single-scale) or a list of tuple (multi-scale). There are 3 multiscale modes: - *ratio_range* is not None: randomly sample a ratio from the ratio range and multiply it with the image scale. - *ratio_range* is None and *multiscale_mode* == “range”: randomly sample a scale from the multiscale range. - *ratio_range* is None and *multiscale_mode* == “value”: randomly sample a scale from multiple scales. :param img_scale: Images scales for resizing. :type img_scale: tuple or list[tuple] :param multiscale_mode: Either “range” or “value”. :type multiscale_mode: str :param ratio_range: (min_ratio, max_ratio) :type ratio_range: tuple[float] :param keep_ratio: Whether to keep the aspect ratio when resizing the

image.

Parameters

- **bbox_clip_border** (*bool*, *optional*) – Whether clip the objects outside the border of the image. Defaults to True.
- **backend** (*str*) – Image resize backend, choices are ‘cv2’ and ‘pillow’. These two backends generates slightly different results. Defaults to ‘cv2’.
- **override** (*bool*, *optional*) – Whether to override *scale* and *scale_factor* so as to call *resize* twice. Default False. If True, after the first resizing, the existed *scale* and *scale_factor* will be ignored so the second resizing can be allowed. This option is a workaround for multiple times of *resize* in DETR. Defaults to False.

__init__(img_scale=None, multiscale_mode='range', ratio_range=None, keep_ratio=True, bbox_clip_border=True, backend='cv2', override=False)

Initialize self. See help(type(self)) for accurate signature.

static random_select(img_scales)

Randomly select an *img_scale* from given candidates. :param img_scales: Images scales for selection. :type img_scales: list[tuple]

Returns Returns a tuple (*img_scale*, *scale_idx*), where *img_scale* is the selected image scale and *scale_idx* is the selected index in the given candidates.

Return type (tuple, int)

static random_sample(img_scales)

Randomly sample an *img_scale* when *multiscale_mode*==‘range’. :param img_scales: Images scale range for sampling.

There must be two tuples in *img_scales*, which specify the lower and upper bound of image scales.

Returns Returns a tuple (img_scale, None), where img_scale is sampled scale and None is just a placeholder to be consistent with `random_select()`.

Return type (tuple, None)

static random_sample_ratio(img_scale, ratio_range)

Randomly sample an img_scale when ratio_range is specified. A ratio will be randomly sampled from the range specified by ratio_range. Then it would be multiplied with img_scale to generate sampled scale. :param img_scale: Images scale base to multiply with ratio. :type img_scale: tuple :param ratio_range: The minimum and maximum ratio to scale

the img_scale.

Returns Returns a tuple (scale, None), where scale is sampled ratio multiplied with img_scale and None is just a placeholder to be consistent with `random_select()`.

Return type (tuple, None)

class easycv.datasets.detection.pipelines.MMRandomFlip(flip_ratio=None, direction='horizontal')

Bases: object

Flip the image & bbox & mask. If the input dict contains the key “flip”, then the flag will be used, otherwise it will be randomly decided by a ratio specified in the init method. When random flip is enabled, flip_ratio/direction can either be a float/string or tuple of float/string. There are 3 flip modes: - flip_ratio is float, direction is string: the image will be

direction`ly flipped with probability of `flip_ratio. E.g., flip_ratio=0.5, direction='horizontal', then image will be horizontally flipped with probability of 0.5.

- **flip_ratio is float, direction is list of string: the image will be** direction[i]`ly flipped with probability of `flip_ratio/len(direction). E.g., flip_ratio=0.5, direction=['horizontal', 'vertical'], then image will be horizontally flipped with probability of 0.25, vertically with probability of 0.25.
- **flip_ratio is list of float, direction is list of string: given** len(flip_ratio) == len(direction), the image will be direction[i]`ly flipped with probability of `flip_ratio[i]. E.g., flip_ratio=[0.3, 0.5], direction=['horizontal', 'vertical'], then image will be horizontally flipped with probability of 0.3, vertically with probability of 0.5.

Parameters

- **flip_ratio** (float | list[float], optional) – The flipping probability. Default: None.
- **direction** (str | list[str], optional) – The flipping direction. Options are ‘horizontal’, ‘vertical’, ‘diagonal’. Default: ‘horizontal’. If input is a list, the length must equal flip_ratio. Each element in flip_ratio indicates the flip probability of corresponding direction.

__init__(flip_ratio=None, direction='horizontal')

Initialize self. See help(type(self)) for accurate signature.

bbox_flip(bboxes, img_shape, direction)

Flip bboxes horizontally. :param bboxes: Bounding boxes, shape (... , 4*k) :type bboxes: numpy.ndarray :param img_shape: Image shape (height, width) :type img_shape: tuple[int] :param direction: Flip direction. Options are ‘horizontal’,

‘vertical’.

Returns Flipped bounding boxes.

Return type numpy.ndarray

```
class easycv.datasets.detection.pipelines.MMPad(size=None, size_divisor=None,
                                                pad_to_square=False, pad_val={'img': 0, 'masks': 0,
                                                'seg': 255})
```

Bases: object

Pad the image & mask. There are two padding modes: (1) pad to a fixed size and (2) pad to the minimum size that is divisible by some number. Added keys are “pad_shape”, “pad_fixed_size”, “pad_size_divisor”, :param size: Fixed padding size. :type size: tuple, optional :param size_divisor: The divisor of padded size. :type size_divisor: int, optional :param pad_to_square: Whether to pad the image into a square.

Currently only used for YOLOX. Default: False.

Parameters **pad_val** (*dict, optional*) – A dict for padding value, the default value is *dict(img=0, masks=0, seg=255)*.

```
__init__(size=None, size_divisor=None, pad_to_square=False, pad_val={'img': 0, 'masks': 0, 'seg': 255})
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.detection.pipelines.MMNormalize(mean, std, to_rgb=True)
```

Bases: object

Normalize the image. Added key is “img_norm_cfg”. :param mean: Mean values of 3 channels. :type mean: sequence :param std: Std values of 3 channels. :type std: sequence :param to_rgb: Whether to convert the image from BGR to RGB,

default is true.

```
__init__(mean, std, to_rgb=True)
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.detection.pipelines.LoadImageFromFile(to_float32=False, color_type='color',
                                                            file_client_args={'backend': 'disk'})
```

Bases: object

Load an image from file. Required keys are “img_prefix” and “img_info” (a dict that must contain the key “filename”). Added or updated keys are “filename”, “img”, “img_shape”, “ori_shape” (same as *img_shape*), “pad_shape” (same as *img_shape*), “scale_factor” (1.0) and “img_norm_cfg” (means=0 and stds=1). :param to_float32: Whether to convert the loaded image to a float32

numpy array. If set to False, the loaded image is an uint8 array. Defaults to False.

Parameters

- **color_type** (*str*) – The flag argument for `mmcv.imfrombytes()`. Defaults to ‘color’.
- **file_client_args** (*dict*) – Arguments to instantiate a FileClient. See `mmcv.fileio.FileClient` for details. Defaults to `dict(backend='disk')`.

```
__init__(to_float32=False, color_type='color', file_client_args={'backend': 'disk'})
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.detection.pipelines.LoadImageFromWebcam(to_float32=False,
                                                             color_type='color',
                                                             file_client_args={'backend':
                                                             'disk'})
```

Bases: [easycv.datasets.detection.pipelines.mmcv_transforms.LoadImageFromFile](#)

Load an image from webcam.

Similar with [LoadImageFromFile](#), but the image read from webcam is in `results['img']`.

```
class easycv.datasets.detection.pipelines.LoadMultiChannelImageFromFiles(to_float32=False,
                                                                           color_type='unchanged',
                                                                           file_client_args={'backend':
                                                                           'disk'})
```

Bases: `object`

Load multi-channel images from a list of separate channel files. Required keys are “img_prefix” and “img_info” (a dict that must contain the key “filename”, which is expected to be a list of filenames). Added or updated keys are “filename”, “img”, “img_shape”, “ori_shape” (same as *img_shape*), “pad_shape” (same as *img_shape*), “scale_factor” (1.0) and “img_norm_cfg” (means=0 and stds=1). :param to_float32: Whether to convert the loaded image to a float32

numpy array. If set to False, the loaded image is an uint8 array. Defaults to False.

Parameters

- **color_type** (*str*) – The flag argument for `mmcv.imfrombytes()`. Defaults to ‘color’.
- **file_client_args** (*dict*) – Arguments to instantiate a `FileClient`. See `mmcv.fileio.FileClient` for details. Defaults to `dict(backend='disk')`.

```
__init__(to_float32=False, color_type='unchanged', file_client_args={'backend': 'disk'})
```

Initialize self. See `help(type(self))` for accurate signature.

```
class easycv.datasets.detection.pipelines.LoadAnnotations(with_bbox=True, with_label=True,
                                                           with_mask=False, with_seg=False,
                                                           poly2mask=True,
                                                           file_client_args={'backend': 'disk'})
```

Bases: `object`

Load multiple types of annotations. :param with_bbox: Whether to parse and load the bbox annotation.

Default: True.

Parameters

- **with_label** (*bool*) – Whether to parse and load the label annotation. Default: True.
- **with_mask** (*bool*) – Whether to parse and load the mask annotation. Default: False.
- **with_seg** (*bool*) – Whether to parse and load the semantic segmentation annotation. Default: False.
- **poly2mask** (*bool*) – Whether to convert the instance masks from polygons to bitmaps. Default: True.
- **file_client_args** (*dict*) – Arguments to instantiate a `FileClient`. See `mmcv.fileio.FileClient` for details. Defaults to `dict(backend='disk')`.

```
__init__(with_bbox=True, with_label=True, with_mask=False, with_seg=False, poly2mask=True,
         file_client_args={'backend': 'disk'})
```

Initialize self. See help(type(self)) for accurate signature.

```
process_polygons(polygons)
```

Convert polygons to list of ndarray and filter invalid polygons. :param polygons: Polygons of one instance.
:type polygons: list[list]

Returns Processed polygons.

Return type list[`numpy.ndarray`]

```
class easycv.datasets.detection.pipelines.MMMultiScaleFlipAug(transforms, img_scale=None,
                                                              scale_factor=None, flip=False,
                                                              flip_direction='horizontal')
```

Bases: `object`

Test-time augmentation with multiple scales and flipping. An example configuration is as followed: .. code-block:

```
img_scale=[(1333, 400), (1333, 800)],
flip=True,
transforms=[
    dict(type='Resize', keep_ratio=True),
    dict(type='RandomFlip'),
    dict(type='Normalize', **img_norm_cfg),
    dict(type='Pad', size_divisor=32),
    dict(type='ImageToTensor', keys=['img']),
    dict(type='Collect', keys=['img']),
]
```

After MultiScaleFlipAug with above configuration, the results are wrapped into lists of the same length as followed: .. code-block:

```
dict(
    img=[...],
    img_shape=[...],
    scale=[(1333, 400), (1333, 400), (1333, 800), (1333, 800)]
    flip=[False, True, False, True]
    ...
)
```

Parameters

- **transforms** (`list[dict]`) – Transforms to apply in each augmentation.
- **img_scale** (`tuple` | `list[tuple]` | `None`) – Images scales for resizing.
- **scale_factor** (`float` | `list[float]` | `None`) – Scale factors for resizing.
- **flip** (`bool`) – Whether apply flip augmentation. Default: `False`.
- **flip_direction** (`str` | `list[str]`) – Flip augmentation directions, options are “horizontal”, “vertical” and “diagonal”. If `flip_direction` is a list, multiple flip augmentations will be applied. It has no effect when `flip == False`. Default: “horizontal”.

```
__init__(transforms, img_scale=None, scale_factor=None, flip=False, flip_direction='horizontal')
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.detection.pipelines.MMRandomCrop(crop_size, crop_type='absolute',
                                                         allow_negative_crop=False,
                                                         recompute_bbox=False,
                                                         bbox_clip_border=True)
```

Bases: object

Random crop the image & bboxes & masks.

The absolute *crop_size* is sampled based on *crop_type* and *image_size*, then the cropped results are generated.

Parameters

- **crop_size** (*tuple*) – The relative ratio or absolute pixels of height and width.
- **crop_type** (*str, optional*) – one of “relative_range”, “relative”, “absolute”, “absolute_range”. “relative” randomly crops ($h * \text{crop_size}[0]$, $w * \text{crop_size}[1]$) part from an input of size (h , w). “relative_range” uniformly samples relative crop size from range $[\text{crop_size}[0], 1]$ and $[\text{crop_size}[1], 1]$ for height and width respectively. “absolute” crops from an input with absolute size ($\text{crop_size}[0]$, $\text{crop_size}[1]$). “absolute_range” uniformly samples crop_h in range $[\text{crop_size}[0], \min(h, \text{crop_size}[1])]$ and crop_w in range $[\text{crop_size}[0], \min(w, \text{crop_size}[1])]$. Default “absolute”.
- **allow_negative_crop** (*bool, optional*) – Whether to allow a crop that does not contain any bbox area. Default False.
- **recompute_bbox** (*bool, optional*) – Whether to re-compute the boxes based on cropped instance masks. Default False.
- **bbox_clip_border** (*bool, optional*) – Whether clip the objects outside the border of the image. Defaults to True.

Note:

- If the image is smaller than the absolute crop size, return the original image.
 - The keys for bboxes, labels and masks must be aligned. That is, *gt_bboxes* corresponds to *gt_labels* and *gt_masks*, and *gt_bboxes_ignore* corresponds to *gt_labels_ignore* and *gt_masks_ignore*.
 - If the crop does not contain any gt-bbox region and *allow_negative_crop* is set to False, skip this image.
-

```
__init__(crop_size, crop_type='absolute', allow_negative_crop=False, recompute_bbox=False,
          bbox_clip_border=True)
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.detection.pipelines.MMFilterAnnotations(min_gt_bbox_wh=(1.0, 1.0),
                                                             min_gt_mask_area=1,
                                                             by_box=True, by_mask=False,
                                                             keep_empty=True)
```

Bases: object

Filter invalid annotations. :param min_gt_bbox_wh: Minimum width and height of ground truth

boxes. Default: (1., 1.)

Parameters

- **min_gt_mask_area** (*int*) – Minimum foreground area of ground truth masks. Default: 1
- **by_box** (*bool*) – Filter instances with bounding boxes not meeting the min_gt_bbox_wh threshold. Default: True

- **by_mask** (*bool*) – Filter instances with masks not meeting `min_gt_mask_area` threshold. Default: False
- **keep_empty** (*bool*) – Whether to return None when it becomes an empty bbox after filtering. Default: True

```
__init__(min_gt_bbox_wh=(1.0, 1.0), min_gt_mask_area=1, by_box=True, by_mask=False, keep_empty=True)
```

Initialize self. See help(type(self)) for accurate signature.

Submodules

easycv.datasets.detection.pipelines.mm_transforms module

class easycv.datasets.detection.pipelines.mm_transforms.**MMToTensor**

Bases: object

Transform image to Tensor. Required key: 'img'. Modifies key: 'img'. :param results: contain all information about training. :type results: dict

class easycv.datasets.detection.pipelines.mm_transforms.**NormalizeTensor**(*mean, std*)

Bases: object

Normalize the Tensor image (CxHxW), with mean and std. Required key: 'img'. Modifies key: 'img'. :param mean: Mean values of 3 channels. :type mean: list[float] :param std: Std values of 3 channels. :type std: list[float]

```
__init__(mean, std)
```

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.detection.pipelines.mm_transforms.**MMosaic**(*img_scale=(640, 640), center_ratio_range=(0.5, 1.5), pad_val=114*)

Bases: object

Mosaic augmentation. Given 4 images, mosaic transform combines them into one output image. The output image is composed of the parts from each sub- image. .. code:: text

```
        mosaic transform center_x
center_y |-----+-----+-----|
        | cropped ||
        |pad | image3 | image4 | | | | +----|-----+-----+
        |
```

The mosaic transform steps are as follows:

1. Choose the mosaic center as the intersections of 4 images
2. Get the left top image according to the index, and randomly sample another 3 images from the custom dataset.
3. Sub image will be cropped if image is larger than mosaic patch

Parameters

- **img_scale** (*Sequence[int]*) – Image size after mosaic pipeline of single image. Default to (640, 640).
- **center_ratio_range** (*Sequence[float]*) – Center ratio range of mosaic output. Default to (0.5, 1.5).
- **pad_val** (*int*) – Pad value. Default to 114.

__init__ (*img_scale=(640, 640), center_ratio_range=(0.5, 1.5), pad_val=114*)

Initialize self. See help(type(self)) for accurate signature.

get_indexes (*dataset*)

Call function to collect indexes. :param dataset: The dataset. :type dataset: `DetImagesMixDataset`

Returns indexes.

Return type list

```
class easycv.datasets.detection.pipelines.mm_transforms.MMMixUp(img_scale=(640, 640),
                                                                ratio_range=(0.5, 1.5),
                                                                flip_ratio=0.5, pad_val=114,
                                                                max_iters=15,
                                                                min_bbox_size=5,
                                                                min_area_ratio=0.2,
                                                                max_aspect_ratio=20)
```

Bases: object

MixUp data augmentation. .. code:: text

mixup transform

The mixup transform steps are as follows::

1. Another random image is picked by dataset and embedded in the top left patch(after padding and resizing)
2. The target of mixup transform is the weighted average of mixup image and origin image.

Parameters

- **img_scale** (*Sequence[int]*) – Image output size after mixup pipeline. Default: (640, 640).
- **ratio_range** (*Sequence[float]*) – Scale ratio of mixup image. Default: (0.5, 1.5).
- **flip_ratio** (*float*) – Horizontal flip ratio of mixup image. Default: 0.5.
- **pad_val** (*int*) – Pad value. Default: 114.

- **max_iters** (*int*) – The maximum number of iterations. If the number of iterations is greater than *max_iters*, but *gt_bbox* is still empty, then the iteration is terminated. Default: 15.
- **min_bbox_size** (*float*) – Width and height threshold to filter bboxes. If the height or width of a box is smaller than this value, it will be removed. Default: 5.
- **min_area_ratio** (*float*) – Threshold of area ratio between original bboxes and wrapped bboxes. If smaller than this value, the box will be removed. Default: 0.2.
- **max_aspect_ratio** (*float*) – Aspect ratio of width and height threshold to filter bboxes. If $\max(h/w, w/h)$ larger than this value, the box will be removed. Default: 20.

__init__ (*img_scale=(640, 640), ratio_range=(0.5, 1.5), flip_ratio=0.5, pad_val=114, max_iters=15, min_bbox_size=5, min_area_ratio=0.2, max_aspect_ratio=20*)

Initialize self. See help(type(self)) for accurate signature.

get_indexes (*dataset*)

Call function to collect indexes. :param dataset: The dataset. :type dataset: `DetImagesMixDataset`

Returns indexes.

Return type list

class `easycv.datasets.detection.pipelines.mm_transforms.MMRandomAffine` (*max_rotate_degree=10.0, max_translate_ratio=0.1, scaling_ratio_range=(0.5, 1.5), max_shear_degree=2.0, border=(0, 0), border_val=(114, 114, 114), min_bbox_size=2, min_area_ratio=0.2, max_aspect_ratio=20*)

Bases: `object`

Random affine transform data augmentation. for yolox This operation randomly generates affine transform matrix which including rotation, translation, shear and scaling transforms. :param *max_rotate_degree*: Maximum degrees of rotation transform.

Default: 10.

Parameters

- **max_translate_ratio** (*float*) – Maximum ratio of translation. Default: 0.1.
- **scaling_ratio_range** (*tuple[float]*) – Min and max ratio of scaling transform. Default: (0.5, 1.5).
- **max_shear_degree** (*float*) – Maximum degrees of shear transform. Default: 2.
- **border** (*tuple[int]*) – Distance from height and width sides of input image to adjust output shape. Only used in mosaic dataset. Default: (0, 0).
- **border_val** (*tuple[int]*) – Border padding values of 3 channels. Default: (114, 114, 114).
- **min_bbox_size** (*float*) – Width and height threshold to filter bboxes. If the height or width of a box is smaller than this value, it will be removed. Default: 2.

- **min_area_ratio** (*float*) – Threshold of area ratio between original bboxes and wrapped bboxes. If smaller than this value, the box will be removed. Default: 0.2.
- **max_aspect_ratio** (*float*) – Aspect ratio of width and height threshold to filter bboxes. If max(h/w, w/h) larger than this value, the box will be removed.

```
__init__(max_rotate_degree=10.0, max_translate_ratio=0.1, scaling_ratio_range=(0.5, 1.5),
          max_shear_degree=2.0, border=(0, 0), border_val=(114, 114, 114), min_bbox_size=2,
          min_area_ratio=0.2, max_aspect_ratio=20)
    Initialize self. See help(type(self)) for accurate signature.
```

```
filter_gt_bboxes(origin_bboxes, wrapped_bboxes)
```

```
class easycv.datasets.detection.pipelines.mm_transforms.MMPPhotoMetricDistortion(brightness_delta=32,
                                                                                  contrast_range=(0.5, 1.5),
                                                                                  saturation_range=(0.5, 1.5),
                                                                                  hue_delta=18)
```

Bases: object

Apply photometric distortion to image sequentially, every transformation is applied with a probability of 0.5. The position of random contrast is in second or second to last. 1. random brightness 2. random contrast (mode 0) 3. convert color from BGR to HSV 4. random saturation 5. random hue 6. convert color from HSV to BGR 7. random contrast (mode 1) 8. randomly swap channels :param brightness_delta: delta of brightness. :type brightness_delta: int :param contrast_range: range of contrast. :type contrast_range: tuple :param saturation_range: range of saturation. :type saturation_range: tuple :param hue_delta: delta of hue. :type hue_delta: int

```
__init__(brightness_delta=32, contrast_range=(0.5, 1.5), saturation_range=(0.5, 1.5), hue_delta=18)
    Initialize self. See help(type(self)) for accurate signature.
```

```
class easycv.datasets.detection.pipelines.mm_transforms.MMResize(img_scale=None,
                                                                    multiscale_mode='range',
                                                                    ratio_range=None,
                                                                    keep_ratio=True,
                                                                    bbox_clip_border=True,
                                                                    backend='cv2',
                                                                    override=False)
```

Bases: object

Resize images & bbox & mask. This transform resizes the input image to some scale. Bboxes and masks are then resized with the same scale factor. If the input dict contains the key “scale”, then the scale in the input dict is used, otherwise the specified scale in the init method is used. If the input dict contains the key “scale_factor” (if MultiScaleFlipAug does not give img_scale but scale_factor), the actual scale will be computed by image shape and scale_factor. *img_scale* can either be a tuple (single-scale) or a list of tuple (multi-scale). There are 3 multiscale modes: - *ratio_range* is not None: randomly sample a ratio from the ratio range and multiply it with the image scale. - *ratio_range* is None and *multiscale_mode* == “range”: randomly sample a scale from the multiscale range. - *ratio_range* is None and *multiscale_mode* == “value”: randomly sample a scale from multiple scales. :param img_scale: Images scales for resizing. :type img_scale: tuple or list[tuple] :param multiscale_mode: Either “range” or “value”. :type multiscale_mode: str :param ratio_range: (min_ratio, max_ratio) :type ratio_range: tuple[float] :param keep_ratio: Whether to keep the aspect ratio when resizing the

image.

Parameters

- **bbox_clip_border** (*bool, optional*) – Whether clip the objects outside the border of the image. Defaults to True.
- **backend** (*str*) – Image resize backend, choices are 'cv2' and 'pillow'. These two backends generates slightly different results. Defaults to 'cv2'.
- **override** (*bool, optional*) – Whether to override *scale* and *scale_factor* so as to call resize twice. Default False. If True, after the first resizing, the existed *scale* and *scale_factor* will be ignored so the second resizing can be allowed. This option is a work-around for multiple times of resize in DETR. Defaults to False.

__init__ (*img_scale=None, multiscale_mode='range', ratio_range=None, keep_ratio=True, bbox_clip_border=True, backend='cv2', override=False*)

Initialize self. See help(type(self)) for accurate signature.

static random_select (*img_scales*)

Randomly select an *img_scale* from given candidates. :param *img_scales*: Images scales for selection.
:type *img_scales*: list[tuple]

Returns Returns a tuple (*img_scale, scale_idx*), where *img_scale* is the selected image scale and *scale_idx* is the selected index in the given candidates.

Return type (tuple, int)

static random_sample (*img_scales*)

Randomly sample an *img_scale* when *multiscale_mode*=='range'. :param *img_scales*: Images scale range for sampling.

There must be two tuples in *img_scales*, which specify the lower and upper bound of image scales.

Returns Returns a tuple (*img_scale, None*), where *img_scale* is sampled scale and *None* is just a placeholder to be consistent with [random_select\(\)](#).

Return type (tuple, None)

static random_sample_ratio (*img_scale, ratio_range*)

Randomly sample an *img_scale* when *ratio_range* is specified. A ratio will be randomly sampled from the range specified by *ratio_range*. Then it would be multiplied with *img_scale* to generate sampled scale. :param *img_scale*: Images scale base to multiply with ratio. :type *img_scale*: tuple :param *ratio_range*: The minimum and maximum ratio to scale

the *img_scale*.

Returns Returns a tuple (*scale, None*), where *scale* is sampled ratio multiplied with *img_scale* and *None* is just a placeholder to be consistent with [random_select\(\)](#).

Return type (tuple, None)

class easycv.datasets.detection.pipelines.mm_transforms.**MMRandomFlip** (*flip_ratio=None, direction='horizontal'*)

Bases: object

Flip the image & bbox & mask. If the input dict contains the key "flip", then the flag will be used, otherwise it will be randomly decided by a ratio specified in the init method. When random flip is enabled, *flip_ratio*/*direction* can either be a float/string or tuple of float/string. There are 3 flip modes: - *flip_ratio* is float, *direction* is string: the image will be

direction``ly flipped with probability of ``*flip_ratio*. E.g., *flip_ratio*=0.5, *direction*='horizontal', then image will be horizontally flipped with probability of 0.5.

- **flip_ratio** is float, **direction** is list of string: the image will be `direction[i]`’ly flipped with probability of `flip_ratio/len(direction)`. E.g., `flip_ratio=0.5`, `direction=['horizontal', 'vertical']`, then image will be horizontally flipped with probability of 0.25, vertically with probability of 0.25.
- **flip_ratio** is list of float, **direction** is list of string: given `len(flip_ratio) == len(direction)`, the image will be `direction[i]`’ly flipped with probability of `flip_ratio[i]`. E.g., `flip_ratio=[0.3, 0.5]`, `direction=['horizontal', 'vertical']`, then image will be horizontally flipped with probability of 0.3, vertically with probability of 0.5.

Parameters

- **flip_ratio** (*float | list[float], optional*) – The flipping probability. Default: None.
- **direction** (*str | list[str], optional*) – The flipping direction. Options are ‘horizontal’, ‘vertical’, ‘diagonal’. Default: ‘horizontal’. If input is a list, the length must equal `flip_ratio`. Each element in `flip_ratio` indicates the flip probability of corresponding direction.

__init__ (*flip_ratio=None, direction='horizontal'*)
Initialize self. See help(type(self)) for accurate signature.

bbox_flip (*bboxes, img_shape, direction*)
Flip bboxes horizontally. :param bboxes: Bounding boxes, shape (... , 4*k) :type bboxes: numpy.ndarray
:param img_shape: Image shape (height, width) :type img_shape: tuple[int] :param direction: Flip direction. Options are ‘horizontal’, ‘vertical’.

Returns Flipped bounding boxes.

Return type numpy.ndarray

```
class easycv.datasets.detection.pipelines.mm_transforms.MMRandomCrop(crop_size,
                                                                    crop_type='absolute',
                                                                    allow_negative_crop=False,
                                                                    recompute_bbox=False,
                                                                    bbox_clip_border=True)
```

Bases: object

Random crop the image & bboxes & masks.

The absolute `crop_size` is sampled based on `crop_type` and `image_size`, then the cropped results are generated.

Parameters

- **crop_size** (*tuple*) – The relative ratio or absolute pixels of height and width.
- **crop_type** (*str, optional*) – one of “relative_range”, “relative”, “absolute”, “absolute_range”. “relative” randomly crops (h * `crop_size[0]`, w * `crop_size[1]`) part from an input of size (h, w). “relative_range” uniformly samples relative crop size from range [`crop_size[0]`, 1] and [`crop_size[1]`, 1] for height and width respectively. “absolute” crops from an input with absolute size (`crop_size[0]`, `crop_size[1]`). “absolute_range” uniformly samples `crop_h` in range [`crop_size[0]`, min(h, `crop_size[1]`)] and `crop_w` in range [`crop_size[0]`, min(w, `crop_size[1]`)]. Default “absolute”.
- **allow_negative_crop** (*bool, optional*) – Whether to allow a crop that does not contain any bbox area. Default False.

- **recompute_bbox** (*bool, optional*) – Whether to re-compute the boxes based on cropped instance masks. Default False.
- **bbox_clip_border** (*bool, optional*) – Whether clip the objects outside the border of the image. Defaults to True.

Note:

- **If the image is smaller than the absolute crop size, return the** original image.
 - The keys for bboxes, labels and masks must be aligned. That is, *gt_bboxes* corresponds to *gt_labels* and *gt_masks*, and *gt_bboxes_ignore* corresponds to *gt_labels_ignore* and *gt_masks_ignore*.
 - If the crop does not contain any gt-bbox region and *allow_negative_crop* is set to False, skip this image.
-

```
__init__(crop_size, crop_type='absolute', allow_negative_crop=False, recompute_bbox=False,
         bbox_clip_border=True)
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.detection.pipelines.mm_transforms.MMPad(size=None, size_divisor=None,
                                                             pad_to_square=False,
                                                             pad_val={'img': 0, 'masks': 0,
                                                             'seg': 255})
```

Bases: object

Pad the image & mask. There are two padding modes: (1) pad to a fixed size and (2) pad to the minimum size that is divisible by some number. Added keys are “pad_shape”, “pad_fixed_size”, “pad_size_divisor”, :param size: Fixed padding size. :type size: tuple, optional :param size_divisor: The divisor of padded size. :type size_divisor: int, optional :param pad_to_square: Whether to pad the image into a square.

Currently only used for YOLOX. Default: False.

Parameters pad_val (*dict, optional*) – A dict for padding value, the default value is *dict(img=0, masks=0, seg=255)*.

```
__init__(size=None, size_divisor=None, pad_to_square=False, pad_val={'img': 0, 'masks': 0, 'seg': 255})
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.detection.pipelines.mm_transforms.MMNormalize(mean, std, to_rgb=True)
```

Bases: object

Normalize the image. Added key is “img_norm_cfg”. :param mean: Mean values of 3 channels. :type mean: sequence :param std: Std values of 3 channels. :type std: sequence :param to_rgb: Whether to convert the image from BGR to RGB,

default is true.

```
__init__(mean, std, to_rgb=True)
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.detection.pipelines.mm_transforms.LoadImageFromFile(to_float32=False,
                                                                           color_type='color',
                                                                           file_client_args={'backend':
                                                                           'disk'})
```

Bases: object

Load an image from file. Required keys are “img_prefix” and “img_info” (a dict that must contain the key “filename”). Added or updated keys are “filename”, “img”, “img_shape”, “ori_shape” (same as *img_shape*), “pad_shape” (same as *img_shape*), “scale_factor” (1.0) and “img_norm_cfg” (means=0 and stds=1). :param to_float32: Whether to convert the loaded image to a float32

numpy array. If set to False, the loaded image is an uint8 array. Defaults to False.

Parameters

- **color_type** (*str*) – The flag argument for `mmcv.imreadbytes()`. Defaults to ‘color’.
- **file_client_args** (*dict*) – Arguments to instantiate a `FileClient`. See `mmcv.fileio.FileClient` for details. Defaults to `dict(backend='disk')`.

__init__ (*to_float32=False, color_type='color', file_client_args={'backend': 'disk'})*
Initialize self. See `help(type(self))` for accurate signature.

```
class easycv.datasets.detection.pipelines.mm_transforms.LoadImageFromWebcam(to_float32=False,
                                                                            color_type='color',
                                                                            file_client_args={'backend':
                                                                            'disk'})
```

Bases: `easycv.datasets.detection.pipelines.mm_transforms.LoadImageFromFile`

Load an image from webcam.

Similar with `LoadImageFromFile`, but the image read from webcam is in `results['img']`.

```
class easycv.datasets.detection.pipelines.mm_transforms.LoadMultiChannelImageFromFiles(to_float32=False,
                                                                                       color_type='unchang
                                                                                       file_client_args={'ba
                                                                                       'disk'})
```

Bases: `object`

Load multi-channel images from a list of separate channel files. Required keys are “img_prefix” and “img_info” (a dict that must contain the key “filename”, which is expected to be a list of filenames). Added or updated keys are “filename”, “img”, “img_shape”, “ori_shape” (same as *img_shape*), “pad_shape” (same as *img_shape*), “scale_factor” (1.0) and “img_norm_cfg” (means=0 and stds=1). :param to_float32: Whether to convert the loaded image to a float32

numpy array. If set to False, the loaded image is an uint8 array. Defaults to False.

Parameters

- **color_type** (*str*) – The flag argument for `mmcv.imreadbytes()`. Defaults to ‘color’.
- **file_client_args** (*dict*) – Arguments to instantiate a `FileClient`. See `mmcv.fileio.FileClient` for details. Defaults to `dict(backend='disk')`.

__init__ (*to_float32=False, color_type='unchanged', file_client_args={'backend': 'disk'})*
Initialize self. See `help(type(self))` for accurate signature.

```
class easycv.datasets.detection.pipelines.mm_transforms.LoadAnnotations(with_bbox=True,
                                                                           with_label=True,
                                                                           with_mask=False,
                                                                           with_seg=False,
                                                                           poly2mask=True,
                                                                           file_client_args={'backend':
                                                                           'disk'})
```

Bases: `object`

Load multiple types of annotations. :param with_bbox: Whether to parse and load the bbox annotation.

Default: True.

Parameters

- **with_label** (*bool*) – Whether to parse and load the label annotation. Default: True.
- **with_mask** (*bool*) – Whether to parse and load the mask annotation. Default: False.
- **with_seg** (*bool*) – Whether to parse and load the semantic segmentation annotation. Default: False.
- **poly2mask** (*bool*) – Whether to convert the instance masks from polygons to bitmaps. Default: True.
- **file_client_args** (*dict*) – Arguments to instantiate a FileClient. See `mmcv.fileio.FileClient` for details. Defaults to `dict(backend='disk')`.

__init__ (*with_bbox=True, with_label=True, with_mask=False, with_seg=False, poly2mask=True, file_client_args={'backend': 'disk'}*)

Initialize self. See `help(type(self))` for accurate signature.

process_polygons (*polygons*)

Convert polygons to list of ndarray and filter invalid polygons. :param polygons: Polygons of one instance.

:type polygons: list[list]

Returns Processed polygons.

Return type list[numpy.ndarray]

```
class easycv.datasets.detection.pipelines.mm_transforms.LoadPanopticAnnotations(with_bbox=True,  
                                                                              with_label=True,  
                                                                              with_mask=True,  
                                                                              with_seg=True,  
                                                                              file_client_args={'backend':  
                                                                              'disk'})
```

Bases: [easycv.datasets.detection.pipelines.mm_transforms.LoadAnnotations](#)

Load multiple types of panoptic annotations.

Parameters

- **with_bbox** (*bool*) – Whether to parse and load the bbox annotation. Default: True.
- **with_label** (*bool*) – Whether to parse and load the label annotation. Default: True.
- **with_mask** (*bool*) – Whether to parse and load the mask annotation. Default: True.
- **with_seg** (*bool*) – Whether to parse and load the semantic segmentation annotation. Default: True.
- **file_client_args** (*dict*) – Arguments to instantiate a FileClient. See `mmcv.fileio.FileClient` for details. Defaults to `dict(backend='disk')`.

__init__ (*with_bbox=True, with_label=True, with_mask=True, with_seg=True, file_client_args={'backend': 'disk'}*)

Initialize self. See `help(type(self))` for accurate signature.

```
class easycv.datasets.detection.pipelines.mm_transforms.MMMultiScaleFlipAug(transforms,
                                                                              img_scale=None,
                                                                              scale_factor=None,
                                                                              flip=False,
                                                                              flip_direction='horizontal')
```

Bases: object

Test-time augmentation with multiple scales and flipping. An example configuration is as followed: .. code-block:

```
img_scale=[(1333, 400), (1333, 800)],
flip=True,
transforms=[
    dict(type='Resize', keep_ratio=True),
    dict(type='RandomFlip'),
    dict(type='Normalize', **img_norm_cfg),
    dict(type='Pad', size_divisor=32),
    dict(type='ImageToTensor', keys=['img']),
    dict(type='Collect', keys=['img']),
]
```

After MultiScaleFlipAug with above configuration, the results are wrapped into lists of the same length as followed: .. code-block:

```
dict(
    img=[...],
    img_shape=[...],
    scale=[(1333, 400), (1333, 400), (1333, 800), (1333, 800)]
    flip=[False, True, False, True]
    ...
)
```

Parameters

- **transforms** (*list[dict]*) – Transforms to apply in each augmentation.
- **img_scale** (*tuple | list[tuple] | None*) – Images scales for resizing.
- **scale_factor** (*float | list[float] | None*) – Scale factors for resizing.
- **flip** (*bool*) – Whether apply flip augmentation. Default: False.
- **flip_direction** (*str | list[str]*) – Flip augmentation directions, options are “horizontal”, “vertical” and “diagonal”. If flip_direction is a list, multiple flip augmentations will be applied. It has no effect when flip == False. Default: “horizontal”.

__init__ (*transforms, img_scale=None, scale_factor=None, flip=False, flip_direction='horizontal'*)
Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.detection.pipelines.mm_transforms.MMFilterAnnotations(min_gt_bbox_wh=(1.0,
1.0),
                                                                              min_gt_mask_area=1,
                                                                              by_box=True,
                                                                              by_mask=False,
                                                                              keep_empty=True)
```

Bases: object

Filter invalid annotations. :param min_gt_bbox_wh: Minimum width and height of ground truth

boxes. Default: (1., 1.)

Parameters

- **min_gt_mask_area** (*int*) – Minimum foreground area of ground truth masks. Default: 1
- **by_box** (*bool*) – Filter instances with bounding boxes not meeting the min_gt_bbox_wh threshold. Default: True
- **by_mask** (*bool*) – Filter instances with masks not meeting min_gt_mask_area threshold. Default: False
- **keep_empty** (*bool*) – Whether to return None when it becomes an empty bbox after filtering. Default: True

```
__init__(min_gt_bbox_wh=(1.0, 1.0), min_gt_mask_area=1, by_box=True, by_mask=False, keep_empty=True)
```

Initialize self. See help(type(self)) for accurate signature.

Submodules

easycv.datasets.detection.mix module

```
class easycv.datasets.detection.mix.DetImagesMixDataset(data_source, pipeline,  
                                                       dynamic_scale=None,  
                                                       skip_type_keys=None, profiling=False,  
                                                       classes=None, yolo_format=True,  
                                                       label_padding=True)
```

Bases: Generic[torch.utils.data.dataset.T_co]

A wrapper of multiple images mixed dataset.

Suitable for training on multiple images mixed data augmentation like mosaic and mixup. For the augmentation pipeline of mixed image data, the *get_indexes* method needs to be provided to obtain the image indexes, and you can set *skip_flags* to change the pipeline running process. At the same time, we provide the *dynamic_scale* parameter to dynamically change the output image size.

output boxes format: cx, cy, w, h

Parameters

- **data_source** (DetSourceCoco) – The dataset to be mixed.
- **pipeline** (*Sequence[dict]*) – Sequence of transform object or config dict to be composed.
- **dynamic_scale** (*tuple[int], optional*) – The image scale can be changed dynamically. Default to None.
- **skip_type_keys** (*list[str], optional*) – Sequence of type string to be skip pipeline. Default to None.
- **label_padding** – out labeling padding [N, 120, 5]

```
__init__(data_source, pipeline, dynamic_scale=None, skip_type_keys=None, profiling=False,  
         classes=None, yolo_format=True, label_padding=True)
```

Args: data_source: Data_source config dict pipeline: Pipeline config list profiling: If set True, will print pipeline time classes: A list of class names, used in evaluation for result and groundtruth visualization

update_skip_type_keys(*skip_type_keys*)

Update skip_type_keys. It is called by an external hook.

Parameters **skip_type_keys** (*list[str]*, *optional*) – Sequence of type string to be skip pipeline.

update_dynamic_scale(*dynamic_scale*)

Update dynamic_scale. It is called by an external hook.

Parameters **dynamic_scale** (*tuple[int]*) – The image scale can be changed dynamically.

results2json(*results*, *outfile_prefix*)

Dump the detection results to a COCO style json file.

There are 3 types of results: proposals, bbox predictions, mask predictions, and they have different data types. This method will automatically recognize the type, and dump them to json files.

Parameters

- **results** (*list[list | tuple | ndarray]*) – Testing results of the dataset.
- **outfile_prefix** (*str*) – The filename prefix of the json files. If the prefix is “somepath/xxx”, the json files will be named “somepath/xxx.bbox.json”, “somepath/xxx.segm.json”, “somepath/xxx.proposal.json”.

Returns *str*: Possible keys are “bbox”, “segm”, “proposal”, and values are corresponding filenames.

Return type *dict[str]*

format_results(*results*, *jsonfile_prefix=None*, ***kwargs*)

Format the results to json (standard format for COCO evaluation).

Parameters

- **results** (*list[tuple | numpy.ndarray]*) – Testing results of the dataset.
- **jsonfile_prefix** (*str | None*) – The prefix of json files. It includes the file path and the prefix of filename, e.g., “a/b/prefix”. If not specified, a temp file will be created. Default: None.

Returns (*result_files*, *tmp_dir*), *result_files* is a dict containing the json filepaths, *tmp_dir* is the temporal directory created for saving json files when *jsonfile_prefix* is not specified.

Return type *tuple*

easycv.datasets.detection.raw module

class easycv.datasets.detection.raw.**DetDataset**(*data_source*, *pipeline*, *profiling=False*, *classes=None*)

Bases: *Generic[torch.utils.data.dataset.T_co]*

Dataset for Detection

__init__(*data_source*, *pipeline*, *profiling=False*, *classes=None*)

Parameters

- **data_source** – Data_source config dict
- **pipeline** – Pipeline config list
- **profiling** – If set True, will print pipeline time

- **classes** – A list of class names, used in evaluation for result and groundtruth visualization

evaluate(*results*, *evaluators=None*, *logger=None*)

Evaluates the detection boxes. :param results: A dictionary containing

detection_boxes: List of length number of test images. Float32 numpy array of shape [num_boxes, 4] and format [ymin, xmin, ymax, xmax] in absolute image coordinates.

detection_scores: List of length number of test images, detection scores for the boxes, float32 numpy array of shape [num_boxes].

detection_classes: List of length number of test images, integer numpy array of shape [num_boxes] containing 1-indexed detection classes for the boxes.

img metas: List of length number of test images, dict of image meta info, containing filename, img_shape, origin_img_shape, scale_factor and so on.

Parameters evaluators – evaluators to calculate metric with results and groundtruth_dict

visualize(*results*, *vis_num=10*, *score_thr=0.3*, ***kwargs*)

Visualize the model output on validation data. :param results: A dictionary containing

detection_boxes: List of length number of test images. Float32 numpy array of shape [num_boxes, 4] and format [ymin, xmin, ymax, xmax] in absolute image coordinates.

detection_scores: List of length number of test images, detection scores for the boxes, float32 numpy array of shape [num_boxes].

detection_classes: List of length number of test images, integer numpy array of shape [num_boxes] containing 1-indexed detection classes for the boxes.

img metas: List of length number of test images, dict of image meta info, containing filename, img_shape, origin_img_shape, scale_factor and so on.

Parameters

- **vis_num** – number of images visualized
- **score_thr** – The threshold to filter box, boxes with scores greater than score_thr will be kept.

Returns: A dictionary containing images: Visualized images. img_metas: List of length number of test images,

dict of image meta info, containing filename, img_shape, origin_img_shape, scale_factor and so on.

22.1.3 easycv.datasets.loader package

class easycv.datasets.loader.**GroupSampler**(*dataset*, *samples_per_gpu=1*)

Bases: Generic[torch.utils.data.sampler.T_co]

__init__(*dataset*, *samples_per_gpu=1*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.loader.**DistributedGroupSampler**(*dataset*, *samples_per_gpu=1*, *seed=0*, *num_replicas=None*, *rank=None*)

Bases: Generic[torch.utils.data.sampler.T_co]

Sampler that restricts data loading to a subset of the dataset. It is especially useful in conjunction with `torch.nn.parallel.DistributedDataParallel`. In such case, each process can pass a `DistributedSampler` instance as a `DataLoader` sampler, and load a subset of the original dataset that is exclusive to it. .. note:

Dataset **is** assumed to be of constant size.

Parameters

- **dataset** – Dataset used for sampling.
- **seed** (*int*, *Optional*) – The seed. Default to 0.
- **num_replicas** (*optional*) – Number of processes participating in distributed training.
- **rank** (*optional*) – Rank of the current process within num_replicas.

__init__ (*dataset*, *samples_per_gpu=1*, *seed=0*, *num_replicas=None*, *rank=None*)
Initialize self. See help(type(self)) for accurate signature.

set_epoch (*epoch*)

`easycv.datasets.loader.build_dataloader(dataset, imgs_per_gpu, workers_per_gpu, num_gpus=1, dist=True, shuffle=True, replace=False, seed=None, reuse_worker_cache=False, odps_config=None, persistent_workers=False, collate_hooks=None, use_repeated_augment_sampler=False, sampler=None, pin_memory=False, **kwargs)`

Build PyTorch `DataLoader`. In distributed training, each GPU/process has a `dataloader`. In non-distributed training, there is only one `dataloader` for all GPUs. :param dataset: A PyTorch dataset. :type dataset: Dataset :param imgs_per_gpu: Number of images on each GPU, i.e., batch size of

each GPU.

Parameters

- **workers_per_gpu** (*int*) – How many subprocesses to use for data loading for each GPU.
- **num_gpus** (*int*) – Number of GPUs. Only used in non-distributed training.
- **dist** (*bool*) – Distributed training/test or not. Default: True.
- **shuffle** (*bool*) – Whether to shuffle the data at every epoch. Default: True.
- **replace** (*bool*) – Replace or not in random shuffle. It works on when shuffle is True.
- **seed** (*int*, *Optional*) – The seed. Default to None.
- **reuse_worker_cache** (*bool*) – If set true, will reuse worker process so that cached data in worker process can be reused.
- **persistent_workers** (*bool*) – After pytorch1.7, could use `persistent_workers=True` to avoid reconstruct dataworker before each epoch, speed up before epoch
- **use_repeated_augment_sampler** (*bool*) – If set true, it will use `RASampler`. Default: False.
- **kwargs** – any keyword argument to be used to initialize `DataLoader`

Returns A PyTorch `dataloader`.

Return type `DataLoader`

```
class easycv.datasets.loader.DistributedGivenIterationSampler(dataset, total_iter, batch_size,  
                                                         num_replicas=None, rank=None,  
                                                         last_iter=- 1)
```

Bases: Generic[torch.utils.data.sampler.T_co]

```
__init__(dataset, total_iter, batch_size, num_replicas=None, rank=None, last_iter=- 1)
```

Initialize self. See help(type(self)) for accurate signature.

```
set_uniform_indices(labels, num_classes)
```

```
gen_new_list()
```

```
set_epoch(epoch)
```

```
class easycv.datasets.loader.DistributedMPSampler(dataset, num_replicas=None, rank=None,  
                                                shuffle=True, split_huge_listfile_byrank=False,  
                                                **kwargs)
```

Bases: torch.utils.data.sampler.Sampler[torch.utils.data.distributed.T_co]

```
__init__(dataset, num_replicas=None, rank=None, shuffle=True, split_huge_listfile_byrank=False,  
        **kwargs)
```

A Distribute sampler which support sample m instance from one class once for classification dataset
dataset: pytorch dataset object num_replicas (optional): Number of processes participating in
distributed training.

rank (optional): Rank of the current process within num_replicas. shuffle (optional): If true (default),
sampler will shuffle the indices split_huge_listfile_byrank: if split, return all indice for each rank, because
list for each rank has been

split before build dataset in dist training

```
generate_indice()
```

```
get_label_dict()
```

```
calculate_this_label_list()
```

```
class easycv.datasets.loader.RASampler(dataset, num_replicas=None, rank=None, shuffle=True,  
                                     num_repeats: int = 3, **kwargs)
```

Bases: Generic[torch.utils.data.sampler.T_co]

Sampler that restricts data loading to a subset of the dataset for distributed, with repeated augmentation. It
ensures that different each augmented version of a sample will be visible to a different process (GPU) Heavily
based on torch.utils.data.DistributedSampler

```
__init__(dataset, num_replicas=None, rank=None, shuffle=True, num_repeats: int = 3, **kwargs)
```

Initialize self. See help(type(self)) for accurate signature.

```
set_epoch(epoch)
```

```
class easycv.datasets.loader.DistributedSampler(dataset, num_replicas=None, rank=None,  
                                              shuffle=True, seed=0, replace=False,  
                                              split_huge_listfile_byrank=False)
```

Bases: torch.utils.data.sampler.Sampler[torch.utils.data.distributed.T_co]

```
__init__(dataset, num_replicas=None, rank=None, shuffle=True, seed=0, replace=False,  
        split_huge_listfile_byrank=False)
```

A Distribute sampler which support sample m instance from one class once for classification dataset :param
dataset: pytorch dataset object :param num_replicas: Number of processes participating in
distributed training.

Parameters

- **rank** (*optional*) – Rank of the current process within num_replicas.
- **shuffle** (*optional*) – If true (default), sampler will shuffle the indices
- **seed** (*int*, *Optional*) – The seed. Default to 0.
- **split_huge_listfile_byrank** – if split, return all indice for each rank, because list for each rank has been split before build dataset in dist training

generate_new_list()

set_uniform_indices(*labels*, *num_classes*)

Submodules**easycv.datasets.loader.build_loader module**

easycv.datasets.loader.build_loader.build_dataloader(*dataset*, *imgs_per_gpu*, *workers_per_gpu*, *num_gpus=1*, *dist=True*, *shuffle=True*, *replace=False*, *seed=None*, *reuse_worker_cache=False*, *odps_config=None*, *persistent_workers=False*, *collate_hooks=None*, *use_repeated_augment_sampler=False*, *sampler=None*, *pin_memory=False*, ***kwargs*)

Build PyTorch DataLoader. In distributed training, each GPU/process has a dataloader. In non-distributed training, there is only one dataloader for all GPUs. :param dataset: A PyTorch dataset. :type dataset: Dataset :param imgs_per_gpu: Number of images on each GPU, i.e., batch size of

each GPU.

Parameters

- **workers_per_gpu** (*int*) – How many subprocesses to use for data loading for each GPU.
- **num_gpus** (*int*) – Number of GPUs. Only used in non-distributed training.
- **dist** (*bool*) – Distributed training/test or not. Default: True.
- **shuffle** (*bool*) – Whether to shuffle the data at every epoch. Default: True.
- **replace** (*bool*) – Replace or not in random shuffle. It works on when shuffle is True.
- **seed** (*int*, *Optional*) – The seed. Default to None.

```

22.1.4 easycv.datasets.pose package

```
class easycv.datasets.pose.PoseTopDownDataset(data_source, pipeline, profiling=False)
```

Bases: Generic[torch.utils.data.dataset.T_co]

PoseTopDownDataset dataset for top-down pose estimation. The dataset loads raw features and apply specified transforms to return a dict containing the image tensors and other information.

Parameters

- **data_source** – Data_source config dict
- **pipeline** – Pipeline config list
- **profiling** – If set True, will print pipeline time

```
__init__(data_source, pipeline, profiling=False)
    Initialize self. See help(type(self)) for accurate signature.
```

```
evaluate(outputs, evaluators, **kwargs)
```

```
class easycv.datasets.pose.HandCocoWholeBodyDataset(data_source, pipeline, profiling=False)
```

Bases: Generic[torch.utils.data.dataset.T_co]

CocoWholeBodyDataset for top-down hand pose estimation.

Parameters

- **data_source** – Data_source config dict
- **pipeline** – Pipeline config list
- **profiling** – If set True, will print pipeline time

```
__init__(data_source, pipeline, profiling=False)
    Initialize self. See help(type(self)) for accurate signature.
```

```
evaluate(outputs, evaluators, **kwargs)
```

```
class easycv.datasets.pose.WholeBodyCocoTopDownDataset(data_source, pipeline, profiling=False)
```

Bases: Generic[torch.utils.data.dataset.T_co]

CocoWholeBodyDataset dataset for top-down pose estimation.

Parameters

- **data_source** – Data_source config dict
- **pipeline** – Pipeline config list
- **profiling** – If set True, will print pipeline time

__init__(*data_source, pipeline, profiling=False*)

Initialize self. See help(type(self)) for accurate signature.

evaluate(*outputs, evaluators, **kwargs*)

Subpackages**easycv.datasets.pose.data_sources package**

class easycv.datasets.pose.data_sources.**PoseTopDownSourceCoco**(*ann_file, img_prefix, data_cfg, dataset_info=None, test_mode=False*)

Bases: [easycv.datasets.pose.data_sources.top_down.PoseTopDownSource](#)

CocoSource for top-down pose estimation.

Microsoft COCO: Common Objects in Context' ECCV'2014 More details can be found in the [paper](#) .

The source loads raw features to build a data meta object containing the image info, annotation info and others.

COCO keypoint indexes:

```
0: 'nose',
1: 'left_eye',
2: 'right_eye',
3: 'left_ear',
4: 'right_ear',
5: 'left_shoulder',
6: 'right_shoulder',
7: 'left_elbow',
8: 'right_elbow',
9: 'left_wrist',
10: 'right_wrist',
11: 'left_hip',
12: 'right_hip',
13: 'left_knee',
14: 'right_knee',
15: 'left_ankle',
16: 'right_ankle'
```

Parameters

- **ann_file** (*str*) – Path to the annotation file.
- **img_prefix** (*str*) – Path to a directory where images are held. Default: None.
- **data_cfg** (*dict*) – config
- **dataset_info** ([DatasetInfo](#)) – A class containing all dataset info.
- **test_mode** (*bool*) – Store True when building test or

- **dataset. Default** (*validation*) – False.

__init__ (*ann_file, img_prefix, data_cfg, dataset_info=None, test_mode=False*)
Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.pose.data_sources.**PoseTopDownSource** (*ann_file, img_prefix, data_cfg, dataset_info, coco_style=True, test_mode=False*)

Bases: object

Class for keypoint 2D top-down pose estimation with single-view RGB image as the data source.

Parameters

- **ann_file** (*str*) – Path to the annotation file.
- **img_prefix** (*str*) – Path to a directory where images are held. Default: None.
- **data_cfg** (*dict*) – config
- **dataset_info** ([DatasetInfo](#)) – A class containing all dataset info.
- **coco_style** (*bool*) – Whether the annotation json is coco-style. Default: True
- **test_mode** (*bool*) – Store True when building test or validation dataset. Default: False.

__init__ (*ann_file, img_prefix, data_cfg, dataset_info, coco_style=True, test_mode=False*)
Initialize self. See help(type(self)) for accurate signature.

load_image (*image_file*)

class easycv.datasets.pose.data_sources.**HandCocoPoseTopDownSource** (*ann_file, img_prefix, data_cfg, dataset_info=None, test_mode=False*)

Bases: [easycv.datasets.pose.data_sources.top_down.PoseTopDownSource](#)

Coco Whole-Body-Hand Source for top-down hand pose estimation.

“Whole-Body Human Pose Estimation in the Wild”, ECCV’2020. More details can be found in the [paper](#).

The dataset loads raw features and apply specified transforms to return a dict containing the image tensors and other information.

COCO-WholeBody Hand keypoint indexes:

```
0: 'wrist',
1: 'thumb1',
2: 'thumb2',
3: 'thumb3',
4: 'thumb4',
5: 'forefinger1',
6: 'forefinger2',
7: 'forefinger3',
8: 'forefinger4',
9: 'middle_finger1',
10: 'middle_finger2',
11: 'middle_finger3',
12: 'middle_finger4',
13: 'ring_finger1',
14: 'ring_finger2',
15: 'ring_finger3',
```

(continues on next page)

(continued from previous page)

```

16: 'ring_finger4',
17: 'pinky_finger1',
18: 'pinky_finger2',
19: 'pinky_finger3',
20: 'pinky_finger4'

```

Parameters

- **ann_file** (*str*) – Path to the annotation file.
- **img_prefix** (*str*) – Path to a directory where images are held. Default: None.
- **data_cfg** (*dict*) – config
- **dataset_info** (*DatasetInfo*) – A class containing all dataset info.
- **test_mode** (*bool*) – Store True when building test or validation dataset. Default: False.

__init__(*ann_file, img_prefix, data_cfg, dataset_info=None, test_mode=False*)

Initialize self. See help(type(self)) for accurate signature.

```

class easycv.datasets.pose.data_sources.WholeBodyCocoTopDownSource(ann_file, img_prefix,
                                                                    data_cfg,
                                                                    dataset_info=None,
                                                                    test_mode=False)

```

Bases: *easycv.datasets.pose.data_sources.top_down.PoseTopDownSource*

CocoWholeBodyDataset dataset for top-down pose estimation.

“Whole-Body Human Pose Estimation in the Wild”, ECCV’2020. More details can be found in the [paper](#) .

The dataset loads raw features and apply specified transforms to return a dict containing the image tensors and other information.

COCO-WholeBody keypoint indexes:

```

0-16: 17 body keypoints,
17-22: 6 foot keypoints,
23-90: 68 face keypoints,
91-132: 42 hand keypoints

```

In total, we have 133 keypoints **for** wholebody pose estimation.

Parameters

- **ann_file** (*str*) – Path to the annotation file.
- **img_prefix** (*str*) – Path to a directory where images are held. Default: None.
- **data_cfg** (*dict*) – config
- **test_mode** (*bool*) – Store True when building test or validation dataset. Default: False.

__init__(*ann_file, img_prefix, data_cfg, dataset_info=None, test_mode=False*)

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.pose.data_sources.PoseTopDownSourceCoco2017(data_cfg, path="",
                                                                    download=True, split='train',
                                                                    dataset_info=None,
                                                                    test_mode=False)
```

Bases: [easycv.datasets.pose.data_sources.coco.PoseTopDownSourceCoco](#)

Parameters

- **path** – target dir
- **download** – whether download
- **split** – train or val
- **data_cfg** (*dict*) – config
- **dataset_info** ([DatasetInfo](#)) – A class containing all dataset info.
- **test_mode** (*bool*) – Store True when building test or
- **dataset. Default** (*validation*) – False.

```
__init__(data_cfg, path="", download=True, split='train', dataset_info=None, test_mode=False)
Initialize self. See help(type(self)) for accurate signature.
```

```
class easycv.datasets.pose.data_sources.PoseTopDownSourceCrowdPose(ann_file, img_prefix,
                                                                    data_cfg,
                                                                    dataset_info=None,
                                                                    test_mode=False, **kwargs)
```

                                                                    split='train',
                                                                    dataset_info=None,
                                                                    test_mode=False)

```

Bases: *easycv.datasets.pose.data_sources.coco.PoseTopDownSourceCoco*

Parameters

- **path** – target dir
- **download** – whether download
- **split** – train or val
- **data_cfg** (*dict*) – config
- **dataset_info** (*DatasetInfo*) – A class containing all dataset info.
- **test_mode** (*bool*) – Store True when building test or
- **dataset. Default** (*validation*) – False.

__init__(*data_cfg, path="", download=True, split='train', dataset_info=None, test_mode=False*)

Initialize self. See help(type(self)) for accurate signature.

easycv.datasets.pose.data_sources.top_down module**class** easycv.datasets.pose.data_sources.top_down.**DatasetInfo**(*dataset_info*)

Bases: object

__init__(*dataset_info*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.pose.data_sources.top_down.**PoseTopDownSource**(*ann_file, img_prefix, data_cfg, dataset_info, coco_style=True, test_mode=False*)

Bases: object

Class for keypoint 2D top-down pose estimation with single-view RGB image as the data source.

Parameters

- **ann_file** (*str*) – Path to the annotation file.
- **img_prefix** (*str*) – Path to a directory where images are held. Default: None.
- **data_cfg** (*dict*) – config
- **dataset_info** (**DatasetInfo**) – A class containing all dataset info.
- **coco_style** (*bool*) – Whether the annotation json is coco-style. Default: True
- **test_mode** (*bool*) – Store True when building test or validation dataset. Default: False.

__init__(*ann_file, img_prefix, data_cfg, dataset_info, coco_style=True, test_mode=False*)

Initialize self. See help(type(self)) for accurate signature.

load_image(*image_file*)**easycv.datasets.pose.pipelines package****class** easycv.datasets.pose.pipelines.**PoseCollect**(*keys, meta_keys, meta_name='img metas'*)

Bases: object

Collect data from the loader relevant to the specific task.

This keeps the items in *keys* as it is, and collect items in *meta_keys* into a meta item called *meta_name*. This is usually the last stage of the data loader pipeline. For example, when *keys*='imgs', *meta_keys*=('filename', 'label', 'original_shape'), *meta_name*='img_metas', the results will be a dict with keys 'imgs' and 'img_metas', where 'img_metas' is a DataContainer of another dict with keys 'filename', 'label', 'original_shape'.

Parameters

- **keys** (*Sequence[str/tuple]*) – Required keys to be collected. If a tuple (key, key_new) is given as an element, the item retrieved by key will be renamed as key_new in collected data.
- **meta_name** (*str*) – The name of the key that contains meta information. This key is always populated. Default: "img_metas".
- **meta_keys** (*Sequence[str/tuple]*) – Keys that are collected under meta_name. The contents of the *meta_name* dictionary depends on *meta_keys*.

__init__(*keys, meta_keys, meta_name='img metas'*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.pose.pipelines.**TopDownRandomFlip**(*flip_prob=0.5*)

Bases: object

Data augmentation with random image flip.

Required keys: 'img', 'joints_3d', 'joints_3d_visible', 'center' and 'ann_info'. Modifies key: 'img', 'joints_3d', 'joints_3d_visible', 'center' and 'flipped'.

Parameters

- **flip** (*bool*) – Option to perform random flip.
- **flip_prob** (*float*) – Probability of flip.

__init__(*flip_prob=0.5*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.pose.pipelines.**TopDownHalfBodyTransform**(*num_joints_half_body=8, prob_half_body=0.3*)

Bases: object

Data augmentation with half-body transform. Keep only the upper body or the lower body at random.

Required keys: 'joints_3d', 'joints_3d_visible', and 'ann_info'. Modifies key: 'scale' and 'center'.

Parameters

- **num_joints_half_body** (*int*) – Threshold of performing half-body transform. If the body has fewer number of joints (< num_joints_half_body), ignore this step.
- **prob_half_body** (*float*) – Probability of half-body transform.

__init__(*num_joints_half_body=8, prob_half_body=0.3*)

Initialize self. See help(type(self)) for accurate signature.

static half_body_transform(*cfg, joints_3d, joints_3d_visible*)

Get center&scale for half-body transform.

class easycv.datasets.pose.pipelines.**TopDownGetRandomScaleRotation**(*rot_factor=40, scale_factor=0.5, rot_prob=0.6*)

Bases: object

Data augmentation with random scaling & rotating.

Required key: 'scale'. Modifies key: 'scale' and 'rotation'.

Parameters

- **rot_factor** (*int*) – Rotating to $[-2*\text{rot_factor}, 2*\text{rot_factor}]$.
- **scale_factor** (*float*) – Scaling to $[1-\text{scale_factor}, 1+\text{scale_factor}]$.
- **rot_prob** (*float*) – Probability of random rotation.

__init__(*rot_factor=40, scale_factor=0.5, rot_prob=0.6*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.pose.pipelines.**TopDownAffine**(*use_udp=False*)

Bases: object

Affine transform the image to make input.

Required keys: 'img', 'joints_3d', 'joints_3d_visible', 'ann_info', 'scale', 'rotation' and 'center'. Modified keys: 'img', 'joints_3d', and 'joints_3d_visible'.

Parameters **use_udp** (*bool*) – To use unbiased data processing. Paper ref: Huang et al. The Devil is in the Details: Delving into Unbiased Data Processing for Human Pose Estimation (CVPR 2020).

__init__ (*use_udp=False*)

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.pose.pipelines.TopDownGenerateTarget(sigma=2, kernel=(11, 11),  
                                                         valid_radius_factor=0.0546875,  
                                                         target_type='GaussianHeatmap',  
                                                         encoding='MSRA',  
                                                         unbiased_encoding=False)
```

Bases: object

Generate the target heatmap.

Required keys: 'joints_3d', 'joints_3d_visible', 'ann_info'. Modified keys: 'target', and 'target_weight'.

Parameters

- **sigma** – Sigma of heatmap gaussian for 'MSRA' approach.
- **kernel** – Kernel of heatmap gaussian for 'Megvii' approach.
- **encoding** (*str*) – Approach to generate target heatmaps. Currently supported approaches: 'MSRA', 'Megvii', 'UDP'. Default: 'MSRA'
- **unbiased_encoding** (*bool*) – Option to use unbiased encoding methods. Paper ref: Zhang et al. Distribution-Aware Coordinate Representation for Human Pose Estimation (CVPR 2020).
- **keypoint_pose_distance** – Keypoint pose distance for UDP. Paper ref: Huang et al. The Devil is in the Details: Delving into Unbiased Data Processing for Human Pose Estimation (CVPR 2020).
- **target_type** (*str*) – supported targets: 'GaussianHeatmap', 'CombinedTarget'. Default: 'GaussianHeatmap' CombinedTarget: The combination of classification target (response map) and regression target (offset map). Paper ref: Huang et al. The Devil is in the Details: Delving into Unbiased Data Processing for Human Pose Estimation (CVPR 2020).

__init__ (*sigma=2, kernel=(11, 11), valid_radius_factor=0.0546875, target_type='GaussianHeatmap', encoding='MSRA', unbiased_encoding=False*)

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.pose.pipelines.TopDownGenerateTargetRegression
```

Bases: object

Generate the target regression vector (coordinates).

Required keys: 'joints_3d', 'joints_3d_visible', 'ann_info'. Modified keys: 'target', and 'target_weight'.

__init__ ()

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.pose.pipelines.TopDownRandomTranslation(trans_factor=0.15,  
                                                             trans_prob=1.0)
```

Bases: object

Data augmentation with random translation.

Required key: 'scale' and 'center'. Modifies key: 'center'.

Notes

bbox height: H bbox width: W

Parameters

- **trans_factor** (*float*) – Translating center to $[-\text{trans_factor}, \text{trans_factor}] * [W, H] + \text{center}$.
- **trans_prob** (*float*) – Probability of random translation.

__init__ (*trans_factor=0.15, trans_prob=1.0*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.pose.pipelines.**TopDownRandomShiftBboxCenter** (*shift_factor: float = 0.16, prob: float = 0.3*)

Bases: object

Random shift the bbox center.

Required key: 'center', 'scale'

Modifies key: 'center'

Parameters

- **shift_factor** (*float*) – The factor to control the shift range, which is $\text{scale} * \text{pixel_std} * \text{scale_factor}$. Default: 0.16
- **prob** (*float*) – Probability of applying random shift. Default: 0.3

pixel_std: float = 200.0

__init__ (*shift_factor: float = 0.16, prob: float = 0.3*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.pose.pipelines.**TopDownGetBboxCenterScale** (*padding: float = 1.25*)

Bases: object

Convert bbox from [x, y, w, h] to center and scale.

The center is the coordinates of the bbox center, and the scale is the bbox width and height normalized by a scale factor.

Required key: 'bbox', 'ann_info'

Modifies key: 'center', 'scale'

Parameters padding (*float*) – bbox padding scale that will be multilied to scale. Default: 1.25

pixel_std: float = 200.0

__init__ (*padding: float = 1.25*)

Initialize self. See help(type(self)) for accurate signature.

Submodules

easycv.datasets.pose.pipelines.transforms module

class easycv.datasets.pose.pipelines.transforms.**PoseCollect**(*keys, meta_keys, meta_name='img metas'*)

Bases: object

Collect data from the loader relevant to the specific task.

This keeps the items in *keys* as it is, and collect items in *meta_keys* into a meta item called *meta_name*. This is usually the last stage of the data loader pipeline. For example, when *keys*='imgs', *meta_keys*=('filename', 'label', 'original_shape'), *meta_name*='img metas', the results will be a dict with keys 'imgs' and 'img metas', where 'img metas' is a DataContainer of another dict with keys 'filename', 'label', 'original_shape'.

Parameters

- **keys** (*Sequence[str|tuple]*) – Required keys to be collected. If a tuple (key, key_new) is given as an element, the item retrieved by key will be renamed as key_new in collected data.
- **meta_name** (*str*) – The name of the key that contains meta information. This key is always populated. Default: "img metas".
- **meta_keys** (*Sequence[str|tuple]*) – Keys that are collected under meta_name. The contents of the *meta_name* dictionary depends on *meta_keys*.

__init__(*keys, meta_keys, meta_name='img metas'*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.pose.pipelines.transforms.**TopDownRandomFlip**(*flip_prob=0.5*)

Bases: object

Data augmentation with random image flip.

Required keys: 'img', 'joints_3d', 'joints_3d_visible', 'center' and 'ann_info'. Modifies key: 'img', 'joints_3d', 'joints_3d_visible', 'center' and 'flipped'.

Parameters

- **flip** (*bool*) – Option to perform random flip.
- **flip_prob** (*float*) – Probability of flip.

__init__(*flip_prob=0.5*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.pose.pipelines.transforms.**TopDownHalfBodyTransform**(*num_joints_half_body=8, prob_half_body=0.3*)

Bases: object

Data augmentation with half-body transform. Keep only the upper body or the lower body at random.

Required keys: 'joints_3d', 'joints_3d_visible', and 'ann_info'. Modifies key: 'scale' and 'center'.

Parameters

- **num_joints_half_body** (*int*) – Threshold of performing half-body transform. If the body has fewer number of joints (< num_joints_half_body), ignore this step.
- **prob_half_body** (*float*) – Probability of half-body transform.

__init__(*num_joints_half_body=8, prob_half_body=0.3*)

Initialize self. See help(type(self)) for accurate signature.

```
static half_body_transform(cfg, joints_3d, joints_3d_visible)
```

Get center&scale for half-body transform.

```
class easycv.datasets.pose.pipelines.transforms.TopDownGetRandomScaleRotation(rot_factor=40,  
                                                                           scale_factor=0.5,  
                                                                           rot_prob=0.6)
```

Bases: object

Data augmentation with random scaling & rotating.

Required key: 'scale'. Modifies key: 'scale' and 'rotation'.

Parameters

- **rot_factor** (*int*) – Rotating to $[-2*\text{rot_factor}, 2*\text{rot_factor}]$.
- **scale_factor** (*float*) – Scaling to $[1-\text{scale_factor}, 1+\text{scale_factor}]$.
- **rot_prob** (*float*) – Probability of random rotation.

```
__init__(rot_factor=40, scale_factor=0.5, rot_prob=0.6)
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.pose.pipelines.transforms.TopDownAffine(use_udp=False)
```

Bases: object

Affine transform the image to make input.

Required keys: 'img', 'joints_3d', 'joints_3d_visible', 'ann_info', 'scale', 'rotation' and 'center'. Modified keys: 'img', 'joints_3d', and 'joints_3d_visible'.

Parameters **use_udp** (*bool*) – To use unbiased data processing. Paper ref: Huang et al. The Devil is in the Details: Delving into Unbiased Data Processing for Human Pose Estimation (CVPR 2020).

```
__init__(use_udp=False)
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.pose.pipelines.transforms.TopDownGenerateTarget(sigma=2, kernel=(11,  
                                                                           11),  
                                                                           valid_radius_factor=0.0546875,  
                                                                           tar-  
                                                                           get_type='GaussianHeatmap',  
                                                                           encoding='MSRA', unbi-  
                                                                           ased_encoding=False)
```

Bases: object

Generate the target heatmap.

Required keys: 'joints_3d', 'joints_3d_visible', 'ann_info'. Modified keys: 'target', and 'target_weight'.

Parameters

- **sigma** – Sigma of heatmap gaussian for 'MSRA' approach.
- **kernel** – Kernel of heatmap gaussian for 'Megvii' approach.
- **encoding** (*str*) – Approach to generate target heatmaps. Currently supported approaches: 'MSRA', 'Megvii', 'UDP'. Default: 'MSRA'
- **unbiased_encoding** (*bool*) – Option to use unbiased encoding methods. Paper ref: Zhang et al. Distribution-Aware Coordinate Representation for Human Pose Estimation (CVPR 2020).

- **keypoint_pose_distance** – Keypoint pose distance for UDP. Paper ref: Huang et al. The Devil is in the Details: Delving into Unbiased Data Processing for Human Pose Estimation (CVPR 2020).
- **target_type** (*str*) – supported targets: ‘GaussianHeatmap’, ‘CombinedTarget’. Default: ‘GaussianHeatmap’ CombinedTarget: The combination of classification target (response map) and regression target (offset map). Paper ref: Huang et al. The Devil is in the Details: Delving into Unbiased Data Processing for Human Pose Estimation (CVPR 2020).

```
__init__(sigma=2, kernel=(11, 11), valid_radius_factor=0.0546875, target_type='GaussianHeatmap', encoding='MSRA', unbiased_encoding=False)
```

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.pose.pipelines.transforms.**TopDownGenerateTargetRegression**

Bases: object

Generate the target regression vector (coordinates).

Required keys: ‘joints_3d’, ‘joints_3d_visible’, ‘ann_info’. Modified keys: ‘target’, and ‘target_weight’.

```
__init__()
```

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.pose.pipelines.transforms.**TopDownRandomTranslation**(*trans_factor=0.15, trans_prob=1.0*)

Bases: object

Data augmentation with random translation.

Required key: ‘scale’ and ‘center’. Modifies key: ‘center’.

Notes

bbox height: H bbox width: W

Parameters

- **trans_factor** (*float*) – Translating center to $[-trans_factor, trans_factor] * [W, H] + center$.
- **trans_prob** (*float*) – Probability of random translation.

```
__init__(trans_factor=0.15, trans_prob=1.0)
```

Initialize self. See help(type(self)) for accurate signature.

easycv.datasets.pose.pipelines.transforms.bbox_xywh2cs(*bbox, aspect_ratio, padding=1.0, pixel_std=200.0*)

Transform the bbox format from (x,y,w,h) into (center, scale)

Parameters

- **bbox** (*ndarray*) – Single bbox in (x, y, w, h)
- **aspect_ratio** (*float*) – The expected bbox aspect ratio (w over h)
- **padding** (*float*) – Bbox padding factor that will be multilied to scale. Default: 1.0
- **pixel_std** (*float*) – The scale normalization factor. Default: 200.0

Returns A tuple containing center and scale. - np.ndarray[float32](2,): Center of the bbox (x, y). - np.ndarray[float32](2,): Scale of the bbox w & h.

Return type tuple

```
easycv.datasets.pose.pipelines.transforms.bbox_cs2xyxy(center, scale, padding=1.0,  
                                                    pixel_std=200.0)
```

```
class easycv.datasets.pose.pipelines.transforms.TopDownGetBboxCenterScale(padding: float =  
                                                                    1.25)
```

Bases: object

Convert bbox from [x, y, w, h] to center and scale.

The center is the coordinates of the bbox center, and the scale is the bbox width and height normalized by a scale factor.

Required key: 'bbox', 'ann_info'

Modifies key: 'center', 'scale'

Parameters **padding** (*float*) – bbox padding scale that will be multilied to scale. Default: 1.25

pixel_std: **float = 200.0**

__init__ (*padding: float = 1.25*)

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.pose.pipelines.transforms.TopDownRandomShiftBboxCenter(shift_factor:  
                                                                    float = 0.16,  
                                                                    prob: float =  
                                                                    0.3)
```

Bases: object

Random shift the bbox center.

Required key: 'center', 'scale'

Modifies key: 'center'

Parameters

- **shift_factor** (*float*) – The factor to control the shift range, which is $\text{scale} * \text{pixel_std} * \text{scale_factor}$. Default: 0.16
- **prob** (*float*) – Probability of applying random shift. Default: 0.3

pixel_std: **float = 200.0**

__init__ (*shift_factor: float = 0.16, prob: float = 0.3*)

Initialize self. See help(type(self)) for accurate signature.

Submodules

easycv.datasets.pose.top_down module

```
class easycv.datasets.pose.top_down.PoseTopDownDataset(data_source, pipeline, profiling=False)
```

Bases: Generic[torch.utils.data.dataset.T_co]

PoseTopDownDataset dataset for top-down pose estimation. The dataset loads raw features and apply specified transforms to return a dict containing the image tensors and other information.

Parameters

- **data_source** – Data_source config dict
- **pipeline** – Pipeline config list
- **profiling** – If set True, will print pipeline time

```
__init__(data_source, pipeline, profiling=False)
    Initialize self. See help(type(self)) for accurate signature.

evaluate(outputs, evaluators, **kwargs)
```

22.1.5 easycv.datasets.selfsup package

Subpackages

easycv.datasets.selfsup.data_sources package

```
class easycv.datasets.selfsup.data_sources.SSLSourceImageList(list_file, root="", max_try=20)
    Bases: object
```

datasource for classification

Parameters

- **list_file** – str / list(str), str means a input image list file path, this file contains records as *image_path label* in list_file list(str) means multi image list, each one contains some records as *image_path label*
- **root** – str / list(str), root path for image_path, each list_file will need a root, if len(root) < len(list_file), we will use root[-1] to fill root list.
- **max_try** – int, max try numbers of reading image

```
__init__(list_file, root="", max_try=20)
    Initialize self. See help(type(self)) for accurate signature.
```

```
static parse_list_file(list_file, root)
```

```
class easycv.datasets.selfsup.data_sources.SSLSourceImageNetFeature(root_path, training=True,
                                                                    data_keyword='feat1',
                                                                    label_keyword='label',
                                                                    dynamic_load=True)
```

Bases: object

```
__init__(root_path, training=True, data_keyword='feat1', label_keyword='label', dynamic_load=True)
    Initialize self. See help(type(self)) for accurate signature.
```

Submodules

easycv.datasets.selfsup.data_sources.image_list module

```
class easycv.datasets.selfsup.data_sources.image_list.SSLSourceImageList(list_file, root="",
                                                                    max_try=20)
```

Bases: object

datasource for classification

Parameters

- **list_file** – str / list(str), str means a input image list file path, this file contains records as *image_path label* in list_file list(str) means multi image list, each one contains some records as *image_path label*

- **root** – str / list(str), root path for image_path, each list_file will need a root, if len(root) < len(list_file), we will use root[-1] to fill root list.
- **max_try** – int, max try numbers of reading image

__init__(list_file, root="", max_try=20)

Initialize self. See help(type(self)) for accurate signature.

static parse_list_file(list_file, root)

easycv.datasets.selfsup.data_sources.imagenet_feature module

```
class easycv.datasets.selfsup.data_sources.imagenet_feature.SSLSourceImageNetFeature(root_path,
                                                                                       train-
                                                                                       ing=True,
                                                                                       data_keyword='feat1',
                                                                                       la-
                                                                                       bel_keyword='label',
                                                                                       dy-
                                                                                       namic_load=True)
```

Bases: object

```

22.1.6 easycv.datasets.shared package

class easycv.datasets.shared.ConcatDataset(*datasets*)

Bases: torch.utils.data.dataset.Dataset[torch.utils.data.dataset.T_co]

A wrapper of concatenated dataset.

Same as torch.utils.data.dataset.ConcatDataset, but concat the group flag for image aspect ratio.

Parameters *datasets* (list[Dataset]) – A list of datasets.

__init__(*datasets*)

Initialize self. See help(type(self)) for accurate signature.

datasets: List[torch.utils.data.dataset.Dataset[torch.utils.data.dataset.T_co]]

cumulative_sizes: List[int]

class easycv.datasets.shared.RepeatDataset(*dataset, times*)

Bases: object

A wrapper of repeated dataset.

The length of repeated dataset will be *times* larger than the original dataset. This is useful when the data loading time is long but the dataset is small. Using RepeatDataset can reduce the data loading time between epochs.

Parameters

- **dataset** (Dataset) – The dataset to be repeated.
- **times** (int) – Repeat times.

__init__(*dataset, times*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.shared.OdpsReader(*table_name, selected_cols=[], excluded_cols=[], random_start=False, odps_io_config=None, image_col=['url_image'], image_type=['url']*)

Bases: object

__init__(*table_name, selected_cols=[], excluded_cols=[], random_start=False, odps_io_config=None, image_col=['url_image'], image_type=['url']*)

Init odps reader and datasource set to load data from odps table

Parameters

- **table_name** (str) – odps table to load
- **selected_cols** (list(str)) – select column
- **excluded_cols** (list(str)) – exclude column
- **random_start** (bool) – random start for odps table
- **odps_io_config** (dict) – odps config contains access_id, access_key, endpoint
- **image_col** (list(str)) – image column names
- **image_type** (list(str)) – image column types support url/base64, must be same length with image type or 0

Returns : None

reset_reader(*dataloader_workid, dataloader_worknum*)

b64_decode()

```
class easycv.datasets.shared.RawDataset(data_source, pipeline, profiling=False)
    Bases: Generic[torch.utils.data.dataset.T_co]

    __init__(data_source, pipeline, profiling=False)
        Initialize self. See help(type(self)) for accurate signature.

    evaluate(scores, keyword, logger=None)

class easycv.datasets.shared.BaseDataset(data_source, pipeline, profiling=False)
    Bases: Generic[torch.utils.data.dataset.T_co]

    Base Dataset

    __init__(data_source, pipeline, profiling=False)
        Initialize self. See help(type(self)) for accurate signature.

    abstract evaluate(results, evaluators, logger=None, **kwargs)

    visualize(results, **kwargs)
        Visualize the model output results on validation data. Returns: A dictionary

        If add image visualization, return dict containing images: List of visualized images.
        img metas: List of length number of test images,

        dict of image meta info, containing filename, img_shape, origin_img_shape,
        scale_factor and so on.

class easycv.datasets.shared.MultiViewDataset(data_source, num_views, pipelines)
    Bases: Generic[torch.utils.data.dataset.T_co]

    The dataset outputs multiple views of an image. The number of views in the output dict depends on num_views.
    The image can be processed by one pipeline or multiple pipelines. :param num_views: The number of different
    views. :type num_views: list :param pipelines: A list of pipelines. :type pipelines: list[list[dict]]

    __init__(data_source, num_views, pipelines)
        Initialize self. See help(type(self)) for accurate signature.

    evaluate(results, evaluators, logger=None)
```

Subpackages

easycv.datasets.shared.data_sources package

```
class easycv.datasets.shared.data_sources.ImageNpy(image_file, label_file=None,
                                                    cache_root='data_cache/')

__init__(*crop*, *mean*, *std*, *prob*=0.0, *device*='gpu', *crop_pos_x*=0.5, *crop_pos_y*=0.5, ***kwargs*)
Initialize self. See help(type(self)) for accurate signature.

easycv.datasets.shared.pipelines.format module

`easycv.datasets.shared.pipelines.format.to_tensor`(*data*)

Convert objects of various python types to torch.Tensor.

Supported types are: `numpy.ndarray`, `torch.Tensor`, `Sequence`, `int` and `float`.

Parameters *data* (`torch.Tensor` | `numpy.ndarray` | `Sequence` | `int` | `float`) – Data to be converted.

class `easycv.datasets.shared.pipelines.format.ImageToTensor`(*keys*)

Bases: object

Convert image to torch.Tensor by given keys.

The dimension order of input image is (H, W, C). The pipeline will convert it to (C, H, W). If only 2 dimension (H, W) is given, the output would be (1, H, W).

Parameters **keys** (*Sequence[str]*) – Key of images to be converted to Tensor.

__init__ (*keys*)

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.shared.pipelines.format.Collect (keys, meta_keys=('filename', 'ori_filename',
                                'ori_img_shape', 'img_shape', 'scale_factor',
                                'pad', 'flip', 'flip_direction', 'img_norm_cfg'))
```

Bases: object

Collect data from the loader relevant to the specific task.

This is usually the last stage of the data loader pipeline. Typically keys is set to some subset of “img”, “proposals”, “gt_bboxes”, “gt_bboxes_ignore”, “gt_labels”, and/or “gt_masks”.

The “img_meta” item is always populated. The contents of the “img_meta” dictionary depends on “meta_keys”. By default this includes:

- “img_shape”: shape of the image input to the network as a tuple (h, w). Note that images may be zero padded on the bottom/right if the batch tensor is larger than this shape.
- “scale_factor”: a float indicating the preprocessing scale
- “flip”: a boolean indicating if image flip transform was used
- “filename”: path to the image file
- “ori_img_shape”: original shape of the image as a tuple (h, w, c)
- “img_norm_cfg”: a dict of normalization information:
 - mean - per channel mean subtraction
 - std - per channel std divisor
 - to_rgb - bool indicating if bgr was converted to rgb

Parameters

- **keys** (*Sequence[str]*) – Keys of results to be collected in data.
- **meta_keys** (*Sequence[str], optional*) – Meta keys to be converted to `mmcv.DataContainer` and collected in `data[img metas]`. Default: `((‘filename’, ‘ori_filename’, ‘ori_img_shape’, ‘img_shape’, ‘scale_factor’, ‘flip’, ‘flip_direction’, ‘img_norm_cfg’))`

__init__ (*keys, meta_keys=('filename', 'ori_filename', 'ori_img_shape', 'img_shape', 'scale_factor', 'pad', 'flip', 'flip_direction', 'img_norm_cfg')*)

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.shared.pipelines.format.DefaultFormatBundle
```

Bases: object

Default formatting bundle. It simplifies the pipeline of formatting common fields, including “img”, “proposals”, “gt_bboxes”, “gt_labels”, “gt_masks” and “gt_semantic_seg”. These fields are formatted as follows. - img: (1)transpose, (2)to tensor, (3)to DataContainer (stack=True) - proposals: (1)to tensor, (2)to DataContainer - gt_bboxes: (1)to tensor, (2)to DataContainer - gt_bboxes_ignore: (1)to tensor, (2)to DataContainer - gt_labels: (1)to tensor, (2)to DataContainer - gt_masks: (1)to tensor, (2)to DataContainer (cpu_only=True) - gt_semantic_seg: (1)unsqueeze dim-0 (2)to tensor, (3)to DataContainer (stack=True)

easycv.datasets.shared.pipelines.third_transforms_wrapper module

`easycv.datasets.shared.pipelines.third_transforms_wrapper.is_child_of(obj, cls)`

`easycv.datasets.shared.pipelines.third_transforms_wrapper.get_args(obj)`

`easycv.datasets.shared.pipelines.third_transforms_wrapper.wrap_torchvision_transforms(transform_obj)`

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.AugMix(severity: int = 3,
                                                                    mixture_width: int = 3,
                                                                    chain_depth: int = -1,
                                                                    alpha: float = 1.0,
                                                                    all_ops: bool = True,
                                                                    interpolation: torchvision.transforms.functional.InterpolationMode = <InterpolationMode.BILINEAR: 'bilinear'>, fill: Optional[List[float]] = None)
```

Bases: `torchvision.transforms.autoaugment.AugMix`

forward(results)

img (PIL Image or Tensor): Image to be transformed.

Returns Transformed image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.AutoAugment(policy: torchvision.transforms.autoaugment.AutoAugmentPolicy = <AutoAugmentPolicy.IMAGENET: 'imagenet'>, interpolation: torchvision.transforms.functional.InterpolationMode = <InterpolationMode.NEAREST: 'nearest'>, fill: Optional[List[float]] = None)
```

Bases: `torchvision.transforms.autoaugment.AutoAugment`

forward(results)

img (PIL Image or Tensor): Image to be transformed.

Returns AutoAugmented image.

Return type PIL Image or Tensor

training: bool

class `easycv.datasets.shared.pipelines.third_transforms_wrapper.CenterCrop`(size)

Bases: `torchvision.transforms.transforms.CenterCrop`

forward(*results*)

Parameters **img** (*PIL Image or Tensor*) – Image to be cropped.

Returns Cropped image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.ColorJitter(brightness=0,
                                                                           contrast=0,
                                                                           saturation=0,
                                                                           hue=0)
```

Bases: torchvision.transforms.transforms.ColorJitter

forward(*results*)

Parameters **img** (*PIL Image or Tensor*) – Input image.

Returns Color jittered image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.ConvertImageDtype(dtype:
                                                                           torch.dtype)
```

Bases: torchvision.transforms.transforms.ConvertImageDtype

forward(*results*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.ElasticTransform(alpha=50.0,
                                                                           sigma=5.0,
                                                                           interpolation=<InterpolationMode.BILINEAR>,
                                                                           fill=0)
```

Bases: torchvision.transforms.transforms.ElasticTransform

forward(*results*)

Parameters **img** (*PIL Image or Tensor*) – Image to be transformed.

Returns Transformed image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.FiveCrop(size)
```

```
    Bases: torchvision.transforms.transforms.FiveCrop
```

```
    forward(results)
```

Parameters **img** (*PIL Image or Tensor*) – Image to be cropped.

Returns tuple of 5 images. Image can be PIL Image or Tensor

```
training: bool
```

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.GaussianBlur(kernel_size,
                                                                              sigma=(0.1,
                                                                              2.0))
```

```
    Bases: torchvision.transforms.transforms.GaussianBlur
```

```
    forward(results)
```

Parameters **img** (*PIL Image or Tensor*) – image to be blurred.

Returns Gaussian blurred image

Return type PIL Image or Tensor

```
training: bool
```

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.Grayscale(num_output_channels=1)
```

```
    Bases: torchvision.transforms.transforms.Grayscale
```

```
    forward(results)
```

Parameters **img** (*PIL Image or Tensor*) – Image to be converted to grayscale.

Returns Grayscaled image.

Return type PIL Image or Tensor

```
training: bool
```

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.Lambda(lambd)
```

```
    Bases: torchvision.transforms.transforms.Lambda
```

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.LinearTransformation(transformation_matrix,
                                                                                      mean_vector)
```

```
    Bases: torchvision.transforms.transforms.LinearTransformation
```

```
    forward(results)
```

Parameters **tensor** (*Tensor*) – Tensor image to be whitened.

Returns Transformed image.

Return type Tensor

```
training: bool
```

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.Normalize(mean, std,
                                                                           inplace=False)
```

```
    Bases: torchvision.transforms.transforms.Normalize
```

```
    forward(results)
```

Parameters **tensor** (*Tensor*) – Tensor image to be normalized.

Returns Normalized Tensor image.

Return type Tensor

training: bool

class easycv.datasets.shared.pipelines.third_transforms_wrapper.**PILToTensor**

Bases: torchvision.transforms.transforms.PILToTensor

class easycv.datasets.shared.pipelines.third_transforms_wrapper.**Pad**(*padding*, *fill=0*,
padding_mode='constant')

Bases: torchvision.transforms.transforms.Pad

forward(*results*)

Parameters **img** (*PIL Image or Tensor*) – Image to be padded.

Returns Padded image.

Return type PIL Image or Tensor

training: bool

class easycv.datasets.shared.pipelines.third_transforms_wrapper.**RandAugment**(*num_ops: int = 2*, *magnitude: int = 9*, *num_magnitude_bins: int = 31*, *interpolation: torchvision.transforms.functional.InterpolationMode.NEAREST: 'nearest'*, *fill: Optional[List[float]] = None*)

Bases: torchvision.transforms.autoaugment.RandAugment

forward(*results*)

img (PIL Image or Tensor): Image to be transformed.

Returns Transformed image.

Return type PIL Image or Tensor

training: bool

class easycv.datasets.shared.pipelines.third_transforms_wrapper.**RandomAdjustSharpness**(*sharpness_factor*, *p=0.5*)

Bases: torchvision.transforms.transforms.RandomAdjustSharpness

forward(*results*)

Parameters **img** (*PIL Image or Tensor*) – Image to be sharpened.

Returns Randomly sharpened image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.RandomAffine(degrees,  
                                                                           translate=None,  
                                                                           scale=None,  
                                                                           shear=None,  
                                                                           interpolation=<InterpolationMode.NEAREST>,  
                                                                           'nearest',  
                                                                           fill=0,  
                                                                           center=None)
```

Bases: torchvision.transforms.transforms.RandomAffine

forward(results)

img (PIL Image or Tensor): Image to be transformed.

Returns Affine transformed image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.RandomAutocontrast(p=0.5)
```

Bases: torchvision.transforms.transforms.RandomAutocontrast

forward(results)

Parameters **img** (PIL Image or Tensor) – Image to be autocontrasted.

Returns Randomly autocontrasted image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.RandomChoice(transforms,  
                                                                           p=None)
```

Bases: torchvision.transforms.transforms.RandomChoice

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.RandomCrop(size,  
                                                                           padding=None,  
                                                                           pad_if_needed=False,  
                                                                           fill=0,  
                                                                           padding_mode='constant')
```

Bases: torchvision.transforms.transforms.RandomCrop

forward(results)

Parameters **img** (PIL Image or Tensor) – Image to be cropped.

Returns Cropped image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.RandomEqualize(p=0.5)
```

Bases: torchvision.transforms.transforms.RandomEqualize

forward(results)

Parameters *img* (PIL Image or Tensor) – Image to be equalized.

Returns Randomly equalized image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.RandomErasing(p=0.5,
                                                                              scale=(0.02,
                                                                              0.33),
                                                                              ratio=(0.3,
                                                                              3.3), value=0,
                                                                              in-
                                                                              place=False)
```

Bases: torchvision.transforms.transforms.RandomErasing

forward(results)

Parameters *img* (Tensor) – Tensor image to be erased.

Returns Erased Tensor image.

Return type img (Tensor)

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.RandomGrayscale(p=0.1)
```

Bases: torchvision.transforms.transforms.RandomGrayscale

forward(results)

Parameters *img* (PIL Image or Tensor) – Image to be converted to grayscale.

Returns Randomly grayscaled image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.RandomHorizontalFlip(p=0.5)
```

Bases: torchvision.transforms.transforms.RandomHorizontalFlip

forward(results)

Parameters *img* (PIL Image or Tensor) – Image to be flipped.

Returns Randomly flipped image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.RandomInvert(p=0.5)
```

Bases: torchvision.transforms.transforms.RandomInvert

forward(results)

Parameters *img* (PIL Image or Tensor) – Image to be inverted.

Returns Randomly color inverted image.

Return type PIL Image or Tensor

training: bool

class easycv.datasets.shared.pipelines.third_transforms_wrapper.**RandomOrder**(*transforms*)
Bases: torchvision.transforms.transforms.RandomOrder

class easycv.datasets.shared.pipelines.third_transforms_wrapper.**RandomPerspective**(*distortion_scale=0.5*,
p=0.5,
interpolation=<InterpolationMode.BILINEAR>,
fill=0)

Bases: torchvision.transforms.transforms.RandomPerspective

forward(*results*)

Parameters **img** (*PIL Image or Tensor*) – Image to be Perspectively transformed.

Returns Randomly transformed image.

Return type PIL Image or Tensor

training: bool

class easycv.datasets.shared.pipelines.third_transforms_wrapper.**RandomPosterize**(*bits*, *p=0.5*)
Bases: torchvision.transforms.transforms.RandomPosterize

forward(*results*)

Parameters **img** (*PIL Image or Tensor*) – Image to be posterized.

Returns Randomly posterized image.

Return type PIL Image or Tensor

training: bool

class easycv.datasets.shared.pipelines.third_transforms_wrapper.**RandomResizedCrop**(*size*,
scale=(0.08, 1.0), *ratio=(0.75, 1.3333333333333333)*,
interpolation=<InterpolationMode.BILINEAR>,
antialias: Optional[bool] = None)

Bases: torchvision.transforms.transforms.RandomResizedCrop

forward(*results*)

Parameters **img** (*PIL Image or Tensor*) – Image to be cropped and resized.

Returns Randomly cropped and resized image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.RandomRotation(degrees,
                                                                              interpolation=<InterpolationMode.NEAREST>,
                                                                              expand=False,
                                                                              center=None,
                                                                              fill=0)
```

Bases: torchvision.transforms.transforms.RandomRotation

forward(*results*)

Parameters **img** (*PIL Image or Tensor*) – Image to be rotated.

Returns Rotated image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.RandomSolarize(threshold,
                                                                              p=0.5)
```

Bases: torchvision.transforms.transforms.RandomSolarize

forward(*results*)

Parameters **img** (*PIL Image or Tensor*) – Image to be solarized.

Returns Randomly solarized image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.RandomVerticalFlip(p=0.5)
```

Bases: torchvision.transforms.transforms.RandomVerticalFlip

forward(*results*)

Parameters **img** (*PIL Image or Tensor*) – Image to be flipped.

Returns Randomly flipped image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.Resize(size, interpolation=<InterpolationMode.BILINEAR>,
                                                                              max_size=None,
                                                                              antialias=None)
```

Bases: torchvision.transforms.transforms.Resize

forward(*results*)

Parameters **img** (*PIL Image or Tensor*) – Image to be scaled.

Returns Rescaled image.

Return type PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.TenCrop(size,
                                                                    vertical_flip=False)
```

Bases: torchvision.transforms.transforms.TenCrop

forward(results)

Parameters *img* (PIL Image or Tensor) – Image to be cropped.

Returns tuple of 10 images. Image can be PIL Image or Tensor

training: bool

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.ToPILImage(mode=None)
```

Bases: torchvision.transforms.transforms.ToPILImage

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.ToTensor
```

Bases: torchvision.transforms.transforms.ToTensor

```
class easycv.datasets.shared.pipelines.third_transforms_wrapper.TrivialAugmentWide(num_magnitude_bins:

                                                                    tional[List[float]]
                                                                    =
                                                                    None)
```

Bases: torchvision.transforms.autoaugment.TrivialAugmentWide

forward(results)

img (PIL Image or Tensor): Image to be transformed.

Returns Transformed image.

Return type PIL Image or Tensor

training: bool

easycv.datasets.shared.pipelines.transforms module

class easycv.datasets.shared.pipelines.transforms.**Compose**(*transforms, profiling=False*)

Bases: object

Compose a data pipeline with a sequence of transforms. :param transforms: Either config dicts of transforms or transform objects. :type transforms: list[dict | callable]

__init__(*transforms, profiling=False*)

Initialize self. See help(type(self)) for accurate signature.

class easycv.datasets.shared.pipelines.transforms.**LoadImage**(*to_float32=False, mode='bgr'*)

Bases: object

Load an image from file or numpy or PIL object. :param to_float32: Whether to convert the loaded image to a float32

numpy array. If set to False, the loaded image is an uint8 array. Defaults to False.

__init__(*to_float32=False, mode='bgr'*)

Initialize self. See help(type(self)) for accurate signature.

Submodules**easycv.datasets.shared.base module**

class easycv.datasets.shared.base.**BaseDataset**(*data_source, pipeline, profiling=False*)

Bases: Generic[torch.utils.data.dataset.T_co]

Base Dataset

__init__(*data_source, pipeline, profiling=False*)

Initialize self. See help(type(self)) for accurate signature.

abstract evaluate(*results, evaluators, logger=None, **kwargs*)

visualize(*results, **kwargs*)

Visualize the model output results on validation data. Returns: A dictionary

If add image visualization, return dict containing images: List of visualized images.

img metas: List of length number of test images,

dict of image meta info, containing filename, img_shape, origin_img_shape, scale_factor and so on.

easycv.datasets.shared.dali_tfrecord_imagenet module

class easycv.datasets.shared.dali_tfrecord_imagenet.**DaliLoaderWrapper**(*dali_loader, batch_size, label_offset=0*)

Bases: object

__init__(*dali_loader, batch_size, label_offset=0*)

Initialize self. See help(type(self)) for accurate signature.

evaluate(*results, evaluators, logger=None*)

evaluate classification task

Parameters

- **results** – a dict of list of tensor, including prediction and groundtruth info, where prediction tensor is NxCan and the same with groundtruth labels.
- **evaluators** – a list of evaluator

Returns a dict of float, different metric values

Return type eval_result

```
class easycv.datasets.shared.dali_tfrecord_imagenet.DaliImageNetTFRecordDataSet(data_source,
                                                                              pipeline,
                                                                              distributed,
                                                                              batch_size,
                                                                              label_offset=0,
                                                                              random_shuffle=True,
                                                                              workers_per_gpu=2)
```

Bases: object

```
__init__(data_source, pipeline, distributed, batch_size, label_offset=0, random_shuffle=True,
          workers_per_gpu=2)
```

Initialize self. See help(type(self)) for accurate signature.

```
get_dataloader()
```

easycv.datasets.shared.dali_tfrecord_multi_view module

```
class easycv.datasets.shared.dali_tfrecord_multi_view.DaliLoaderWrapper(dali_loader,
                                                                           batch_size,
                                                                           return_list)
```

Bases: object

```
__init__(dali_loader, batch_size, return_list)
```

Initialize self. See help(type(self)) for accurate signature.

```
class easycv.datasets.shared.dali_tfrecord_multi_view.DaliTFRecordMultiViewDataset(data_source,
                                                                              num_views,
                                                                              pipelines,
                                                                              distributed,
                                                                              batch_size,
                                                                              random_shuffle=True,
                                                                              workers_per_gpu=2)
```

Bases: object

Adapt to dali, the dataset outputs multiple views of an image. The number of views in the output dict depends on *num_views*. The image can be processed by one pipeline or multiple pipelines. :param num_views: The number of different views. :type num_views: list :param pipelines: A list of pipelines. :type pipelines: list[list[dict]]

```
__init__(data_source, num_views, pipelines, distributed, batch_size, random_shuffle=True,
          workers_per_gpu=2)
```

Initialize self. See help(type(self)) for accurate signature.

`get_dataloader()`

`easycv.datasets.shared.dataset_wrappers` module

class `easycv.datasets.shared.dataset_wrappers.ConcatDataset(datasets)`

Bases: `torch.utils.data.dataset.Dataset[torch.utils.data.dataset.T_co]`

A wrapper of concatenated dataset.

Same as `torch.utils.data.dataset.ConcatDataset`, but concat the group flag for image aspect ratio.

Parameters `datasets` (`list[Dataset]`) – A list of datasets.

`__init__(datasets)`

Initialize self. See `help(type(self))` for accurate signature.

datasets: `List[torch.utils.data.dataset.Dataset[torch.utils.data.dataset.T_co]]`

cumulative_sizes: `List[int]`

class `easycv.datasets.shared.dataset_wrappers.RepeatDataset(dataset, times)`

Bases: `object`

A wrapper of repeated dataset.

The length of repeated dataset will be *times* larger than the original dataset. This is useful when the data loading time is long but the dataset is small. Using `RepeatDataset` can reduce the data loading time between epochs.

Parameters

- **dataset** (`Dataset`) – The dataset to be repeated.
- **times** (`int`) – Repeat times.

`__init__(dataset, times)`

Initialize self. See `help(type(self))` for accurate signature.

`easycv.datasets.shared.multi_view` module

class `easycv.datasets.shared.multi_view.MultiViewDataset(data_source, num_views, pipelines)`

Bases: `Generic[torch.utils.data.dataset.T_co]`

The dataset outputs multiple views of an image. The number of views in the output dict depends on *num_views*. The image can be processed by one pipeline or multiple pipelines. :param *num_views*: The number of different views. :type *num_views*: list :param *pipelines*: A list of pipelines. :type *pipelines*: list[list[dict]]

`__init__(data_source, num_views, pipelines)`

Initialize self. See `help(type(self))` for accurate signature.

evaluate(*results, evaluators, logger=None*)

easycv.datasets.shared.odps_reader module

easycv.datasets.shared.odps_reader.set_dataloader_workid(*value*)

easycv.datasets.shared.odps_reader.set_dataloader_worknum(*value*)

easycv.datasets.shared.odps_reader.get_dist_image(*img_url*, *max_try*=10)

```
class easycv.datasets.shared.odps_reader.OdpsReader(table_name, selected_cols=[],  
                                                    excluded_cols=[], random_start=False,  
                                                    odps_io_config=None, image_col=['url_image'],  
                                                    image_type=['url'])
```

Bases: object

```
__init__(table_name, selected_cols=[], excluded_cols=[], random_start=False, odps_io_config=None,  
         image_col=['url_image'], image_type=['url'])
```

Init odps reader and datasource set to load data from odps table

Parameters

- **table_name** (*str*) – odps table to load
- **selected_cols** (*list(str)*) – select column
- **excluded_cols** (*list(str)*) – exclude column
- **random_start** (*bool*) – random start for odps table
- **odps_io_config** (*dict*) – odps config contains access_id, access_key, endpoint
- **image_col** (*list(str)*) – image column names
- **image_type** (*list(str)*) – image column types support url/base64, must be same length with image type or 0

Returns : None

reset_reader(*dataloader_workid*, *dataloader_worknum*)

b64_decode()

easycv.datasets.shared.raw module

```
class easycv.datasets.shared.raw.RawDataset(data_source, pipeline, profiling=False)
```

Bases: Generic[torch.utils.data.dataset.T_co]

```
__init__(data_source, pipeline, profiling=False)
```

Initialize self. See help(type(self)) for accurate signature.

evaluate(*scores*, *keyword*, *logger*=None)

22.1.7 easycv.datasets.utils package

Submodules

easycv.datasets.utils.tfrecord_util module

`easycv.datasets.utils.tfrecord_util.get_imagenet_dali_tfrecord_feature()`

`easycv.datasets.utils.tfrecord_util.get_path_and_index(file_list_or_path)`

`easycv.datasets.utils.tfrecord_util.download_tfrecord(file_list_or_path, target_path, slice_count=1, slice_id=0, force=False)`

Download data from oss. Use the processes on the gpus to slice download, each gpu process downloads part of the data. The number of slices is the same as the number of gpu processes. Support tfrecord of ImageNet style. tfrecord_dir

|—train1 |—train1.idx |—train2 |—train2.idx |—...

Parameters

- **file_list_or_path** – A list of absolute data path or a path str type(`file_list`) == list means this is the list type(`file_list`) == str means `open(file_list).readlines()`
- **target_path** – A str, download path
- **slice_count** – Download worker num
- **slice_id** – Download worker ID
- **force** – If false, skip download if the file already exists in the target path. If true, recopy and replace the original file.

Returns list of str, download tfrecord path index_path: list of str, download tfrecord idx path

Return type path

easycv.datasets.utils.type_util module

`easycv.datasets.utils.type_util.is_dali_dataset_type(type_name)`

22.2 Submodules

22.3 easycv.datasets.builder module

`easycv.datasets.builder.build_dataset(cfg, default_args=None)`

`easycv.datasets.builder.build_dali_dataset(cfg, default_args=None)`

`easycv.datasets.builder.build_datasource(cfg)`

`easycv.datasets.builder.build_sampler(cfg, default_args=None)`

22.4 easycv.datasets.registry module

EASYCV.HOOKS PACKAGE

```
class easycv.hooks.BestCkptSaverHook(by_epoch=True, save_optimizer=True, best_metric_name=[],  
                                     best_metric_type=[], **kwargs)
```

Bases: `mmcv.runner.hooks.hook.Hook`

Save checkpoints periodically.

Parameters

- **by_epoch** (*bool*) – Saving checkpoints by epoch or by iteration. Default: True.
- **save_optimizer** (*bool*) – Whether to save optimizer state_dict in the checkpoint. It is usually used for resuming experiments. Default: True.
- **best_metric_name** (*List(str)*) – metric name to save best, such as “neck_top1”... Default: [], do not save anything
- **best_metric_type** (*List(str)*) – metric type to define best, should be “max”, “min” if len(best_metric_type) <= len(best_metric_name), use “max” to append.

```
__init__(by_epoch=True, save_optimizer=True, best_metric_name=[], best_metric_type=[], **kwargs)  
Initialize self. See help(type(self)) for accurate signature.
```

```
before_run(runner)
```

```
after_train_epoch(runner)
```

```
easycv.hooks.build_hook(cfg, default_args=None)
```

```
class easycv.hooks.BYOLHook(end_momentum=1.0, **kwargs)
```

Bases: `mmcv.runner.hooks.hook.Hook`

Hook in BYOL

This hook including momentum adjustment in BYOL following: $m = 1 - (1 - m_0) * (\cos(\pi * k / K) + 1) / 2$, k: current step, K: total steps.

```
__init__(end_momentum=1.0, **kwargs)  
Initialize self. See help(type(self)) for accurate signature.
```

```
before_train_iter(runner)
```

```
class easycv.hooks.DINOHook(momentum_teacher=0.996, weight_decay=0.04, weight_decay_end=0.4,  
                             **kwargs)
```

Bases: `mmcv.runner.hooks.hook.Hook`

Hook in DINO

```
__init__(momentum_teacher=0.996, weight_decay=0.04, weight_decay_end=0.4, **kwargs)  
Initialize self. See help(type(self)) for accurate signature.
```

before_run(runner)

before_train_iter(runner)

after_train_iter(runner)

before_train_epoch(runner)

class easycv.hooks.**EMAHook**(decay=0.9999, copy_model_attr=())

Bases: `mmcv.runner.hooks.hook.Hook`

Hook to carry out Exponential Moving Average

__init__(decay=0.9999, copy_model_attr=())

Parameters

- **decay** – decay rate for exponential moving average
- **copy_model_attr** – attribute to copy from origin model to ema model

before_run(runner)

before_train_epoch(runner)

after_train_iter(runner)

class easycv.hooks.**DistEvalHook**(dataloader, interval=1, mode='test', initial=False, gpu_collect=False, flush_buffer=True, broadcast_bn_buffer=True, **eval_kwargs)

Bases: [easycv.hooks.eval_hook.EvalHook](#)

Distributed evaluation hook.

dataloader

A PyTorch dataloader.

Type DataLoader

interval

Evaluation interval (by epochs). Default: 1.

Type int

mode

model forward mode

Type str

tmpdir

Temporary directory to save the results of all processes. Default: None.

Type str | None

gpu_collect

Whether to use gpu or cpu to collect results. Default: False.

Type bool

broadcast_bn_buffer

Whether to broadcast the buffer(`running_mean` and `running_var`) of rank 0 to other rank before evaluation.
Default: True.

Type bool

```

__init__(dataloader, interval=1, mode='test', initial=False, gpu_collect=False, flush_buffer=True,
         broadcast_bn_buffer=True, **eval_kwargs)
    Initialize self. See help(type(self)) for accurate signature.

after_train_epoch(runner)

class easycv.hooks.EvalHook(dataloader, initial=False, interval=1, mode='test', flush_buffer=True,
                           **eval_kwargs)
    Bases: mmcv.runner.hooks.hook.Hook
    Evaluation hook.

    dataloader
        A PyTorch dataloader.
        Type DataLoader

    interval
        Evaluation interval (by epochs). Default: 1.
        Type int

    mode
        model forward mode
        Type str

    flush_buffer
        flush log buffer
        Type bool

__init__(dataloader, initial=False, interval=1, mode='test', flush_buffer=True, **eval_kwargs)
    Initialize self. See help(type(self)) for accurate signature.

before_run(runner)

```

Bases: mmcv.runner.hooks.hook.Hook

upload log files and checkpoints to oss when training on pai

```
__init__(work_dir, oss_work_dir, interval=1, ckpt_filename_tmpl='epoch_{}.pth', export_ckpt_filename_tmpl='epoch_{}_export.pt', other_file_list=[], iter_interval=None)
```

Parameters

- **work_dir** – work_dir in cfg
- **oss_work_dir** – oss directory where to upload local files in work_dir
- **interval** – upload frequency
- **ckpt_filename_tmpl** – checkpoint filename template
- **other_file_list** – other file need to be upload to oss
- **iter_interval** – upload frequency by iter interval, default to be None, means do it with certain assignment

```
upload_file(runner)
```

```
after_train_iter(runner)
```

```
after_train_epoch(runner)
```

```
after_run(runner)
```

```
class easycv.hooks.TIMEHook(end_momentum=1.0, **kwargs)
```

Bases: mmcv.runner.hooks.hook.Hook

This hook to show time for runner running process

```

__init__(end_momentum=1.0, **kwargs)
    Initialize self. See help(type(self)) for accurate signature.

before_train_iter(runner)

after_train_iter(runner)

class easycv.hooks.SWAVHook(gpu_batch_size=32, dump_path='data', **kwargs)
    Bases: mmcv.runner.hooks.hook.Hook
    Hook in SWAV

__init__(gpu_batch_size=32, dump_path='data', **kwargs)
    Initialize self. See help(type(self)) for accurate signature.

before_run(runner)

before_train_epoch(runner)

after_train_epoch(runner)

class easycv.hooks.SyncNormHook(no_aug_epochs=15, interval=1, **kwargs)
    Bases: mmcv.runner.hooks.hook.Hook
    Synchronize Norm states after training epoch, currently used in YOLOX.

    Parameters
    • no_aug_epochs (int) – The number of latter epochs in the end of the training to switch
      to synchronizing norm interval. Default: 15.
    • interval (int) – Synchronizing norm interval. Default: 1.

__init__(no_aug_epochs=15, interval=1, **kwargs)
    Initialize self. See help(type(self)) for accurate signature.

before_train_epoch(runner)

after_train_epoch(runner)
    Synchronizing norm.

class easycv.hooks.SyncRandomSizeHook(ratio_range=(14, 26), img_scale=(640, 640), interval=10,
                                       device='cuda', **kwargs)
    Bases: mmcv.runner.hooks.hook.Hook
    Change and synchronize the random image size across ranks, currently used in YOLOX.

    Parameters
    • ratio_range (tuple[int]) – Random ratio range. It will be multiplied by 32, and then
      change the dataset output image size. Default: (14, 26).
    • img_scale (tuple[int]) – Size of input image. Default: (640, 640).
    • interval (int) – The interval of change image size. Default: 10.
    • device (torch.device | str) – device for returned tensors. Default: 'cuda'.

__init__(ratio_range=(14, 26), img_scale=(640, 640), interval=10, device='cuda', **kwargs)
    Initialize self. See help(type(self)) for accurate signature.

after_train_iter(runner)
    Change the dataset output image size.

class easycv.hooks.TensorboardLoggerHookV2(log_dir=None, interval=10, ignore_last=True,
                                             reset_flag=False, by_epoch=True)
    Bases: mmcv.runner.hooks.logger.tensorboard.TensorboardLoggerHook

```

visualization_log(runner)

Images Visualization. *visualization_buffer* is a dictionary containing:

images (list): list of visualized images. img metas (list of dict, optional): dict containing ori_filename and so on.

ori_filename will be displayed as the tag of the image by default.

log(runner)

after_train_iter(runner)

class easycv.hooks.WandbLoggerHookV2(*init_kwargs=None, interval=10, ignore_last=True, reset_flag=False, commit=True, by_epoch=True, with_step=True*)

Bases: mmcv.runner.hooks.logger.wandb.WandbLoggerHook

visualization_log(runner)

Images Visualization. *visualization_buffer* is a dictionary containing:

images (list): list of visualized images. img metas (list of dict, optional): dict containing ori_filename and so on.

ori_filename will be displayed as the tag of the image by default.

log(runner)

after_train_iter(runner)

class easycv.hooks.YOLOXLRUpdaterHook(*num_last_epochs, **kwargs*)

Bases: mmcv.runner.hooks.lr_updater.CosineAnnealingLRUpdaterHook

YOLOX learning rate scheme.

There are two main differences between YOLOXLRUpdaterHook and CosineAnnealingLRUpdaterHook.

1. **When the current running epoch is greater than** *max_epoch-last_epoch*, a fixed learning rate will be used
2. The exp warmup scheme is different with LRUpdaterHook in MMCV

Parameters num_last_epochs (int) – The number of epochs with a fixed learning rate before the end of the training.

__init__(num_last_epochs, **kwargs)

Initialize self. See help(type(self)) for accurate signature.

get_warmup_lr(cur_iters)

get_lr(runner, base_lr)

class easycv.hooks.YOLOXModeSwitchHook(*no_aug_epochs=15, skip_type_keys=('MMMosaic', 'MMRandomAffine', 'MMMixUp'), **kwargs*)

Bases: mmcv.runner.hooks.hook.Hook

Switch the mode of YOLOX during training.

This hook turns off the mosaic and mixup data augmentation and switches to use L1 loss in bbox_head.

Parameters no_aug_epochs – The number of latter epochs in the end of the training to close the data augmentation and switch to L1 loss. Default: 15.

__init__(no_aug_epochs=15, skip_type_keys=('MMMosaic', 'MMRandomAffine', 'MMMixUp'), **kwargs)

Initialize self. See help(type(self)) for accurate signature.

```

before_train_epoch(runner)
    Close mosaic and mixup augmentation and switches to use L1 loss.

class easycv.hooks.MixupCollateHook(**kwargs)
    Bases: easycv.hooks.collate_hook.BaseCollateHook

    Mixedup data batch, should be used after merges a list of samples to form a mini-batch of Tensor(s).

    __init__(**kwargs)
        Initialize self. See help(type(self)) for accurate signature.

    after_collate(results)

class easycv.hooks.PreLoggerHook(interval=10, ignore_last=True, reset_flag=False, by_epoch=True)
    Bases: mmcv.runner.hooks.logger.base.LoggerHook

    fetch_tensor(runner, n=0)
        Fetch latest n values or all values, process tensor type, convert to numpy for dump logs.

    after_train_iter(runner)

    after_val_epoch(runner)

class easycv.hooks.StepFixCosineAnnealingLrUpdaterHook(min_lr=None, min_lr_ratio=None,
                                                         **kwargs)
    Bases: mmcv.runner.hooks.lr_updater.CosineAnnealingLrUpdaterHook

    get_warmup_lr(cur_iters)

    get_lr(runner, base_lr)

class easycv.hooks.CosineAnnealingWarmupByEpochLrUpdaterHook(min_lr=None, min_lr_ratio=None,
                                                                **kwargs)
    Bases: mmcv.runner.hooks.lr_updater.CosineAnnealingLrUpdaterHook

    before_train_iter(runner: mmcv.runner.base_runner.BaseRunner)

class easycv.hooks.ThroughputHook(warmup_iters=0, **kwargs)
    Bases: mmcv.runner.hooks.hook.Hook

    Count the throughput per second of all steps in the history. warmup_iters can be set to skip the calculation of the
    first few steps, if the initialization of the first few steps is slow.

    __init__(warmup_iters=0, **kwargs) → None
        Initialize self. See help(type(self)) for accurate signature.

    before_train_epoch(runner)
        reset per epoch

    before_train_iter(runner)

    after_train_iter(runner)

class easycv.hooks.AMPFP16OptimizerHook(update_interval=1, grad_clip=None, coalesce=True,
                                          bucket_size_mb=-1, ignore_key=[], ignore_key_epoch=[],
                                          loss_scale={})
    Bases: easycv.hooks.optimizer_hook.OptimizerHook

    __init__(update_interval=1, grad_clip=None, coalesce=True, bucket_size_mb=-1, ignore_key=[],
              ignore_key_epoch=[], loss_scale={})
        ignore_key: [str,...], ignore_key[i], name of parameters, which's gradient will be set to zero be-
        fore every optimizer step when epoch < ignore_key_epoch[i] ignore_key_epoch: [int,...], epoch < ig-
        nore_key_epoch[i], ignore_key[i]'s gradient will be set to zero. loss_scale (float | dict): grade scale config.
        If loss_scale is a float, static loss scaling will be used with the specified scale.

```

It can also be a dict containing arguments of GradScaler. For Pytorch ≥ 1.6 , we use official `torch.cuda.amp.GradScaler`. please refer to: <https://pytorch.org/docs/stable/amp.html#torch.cuda.amp.GradScaler> for the parameters.

`before_run(runner)`

`after_train_iter(runner)`

23.1 Submodules

23.2 easycv.hooks.best_ckpt_saver_hook module

```
class easycv.hooks.best_ckpt_saver_hook.BestCkptSaverHook(by_epoch=True, save_optimizer=True,  
                                                         best_metric_name=[],  
                                                         best_metric_type=[], **kwargs)
```

Bases: `mmcv.runner.hooks.hook.Hook`

Save checkpoints periodically.

Parameters

- **by_epoch** (*bool*) – Saving checkpoints by epoch or by iteration. Default: True.
- **save_optimizer** (*bool*) – Whether to save optimizer state_dict in the checkpoint. It is usually used for resuming experiments. Default: True.
- **best_metric_name** (*List(str)*) – metric name to save best, such as “neck_top1”... Default: [], do not save anything
- **best_metric_type** (*List(str)*) – metric type to define best, should be “max”, “min” if `len(best_metric_type) <= len(best_metric_name)`, use “max” to append.

```
__init__(by_epoch=True, save_optimizer=True, best_metric_name=[], best_metric_type=[], **kwargs)
```

Initialize self. See `help(type(self))` for accurate signature.

`before_run(runner)`

`after_train_epoch(runner)`

23.3 easycv.hooks.builder module

```
easycv.hooks.builder.build_hook(cfg, default_args=None)
```

23.4 easycv.hooks.byol_hook module

```
class easycv.hooks.byol_hook.BYOLHook(end_momentum=1.0, **kwargs)
```

Bases: `mmcv.runner.hooks.hook.Hook`

Hook in BYOL

This hook including momentum adjustment in BYOL following: $m = 1 - (1 - m_0) * (\cos(\pi * k / K) + 1) / 2$, k : current step, K : total steps.

```
__init__(end_momentum=1.0, **kwargs)
```

Initialize self. See `help(type(self))` for accurate signature.

`before_train_iter(runner)`

23.5 easycv.hooks.dino_hook module

`easycv.hooks.dino_hook.cosine_scheduler(base_value, final_value, epochs, niter_per_ep, warmup_epochs=0, start_warmup_value=0)`

class `easycv.hooks.dino_hook.DINOHook(momentum_teacher=0.996, weight_decay=0.04, weight_decay_end=0.4, **kwargs)`

Bases: `mmcv.runner.hooks.hook.Hook`

Hook in DINO

`__init__(momentum_teacher=0.996, weight_decay=0.04, weight_decay_end=0.4, **kwargs)`
Initialize self. See help(type(self)) for accurate signature.

`before_run(runner)`

`before_train_iter(runner)`

`after_train_iter(runner)`

`before_train_epoch(runner)`

23.6 easycv.hooks.ema_hook module

class `easycv.hooks.ema_hook.ModelEMA(model, decay=0.9999, updates=0)`

Bases: `object`

Model Exponential Moving Average from <https://github.com/rwightman/pytorch-image-models> Keep a moving average of everything in the model state_dict (parameters and buffers). This is intended to allow functionality like https://www.tensorflow.org/api_docs/python/tf/train/ExponentialMovingAverage A smoothed version of the weights is necessary for some training schemes to perform well. This class is sensitive where it is initialized in the sequence of model init, GPU assignment and distributed training wrappers.

In Yolo5s, ema help increase mAP from 0.27 to 0.353

`__init__(model, decay=0.9999, updates=0)`
Initialize self. See help(type(self)) for accurate signature.

`update(model)`

`update_attr(model, include=(), exclude=('process_group', 'reducer'))`

class `easycv.hooks.ema_hook.EMAHook(decay=0.9999, copy_model_attr=())`

Bases: `mmcv.runner.hooks.hook.Hook`

Hook to carry out Exponential Moving Average

`__init__(decay=0.9999, copy_model_attr=())`

Parameters

- **decay** – decay rate for exponential moving average
- **copy_model_attr** – attribute to copy from origin model to ema model

`before_run(runner)`

before_train_epoch(runner)

after_train_iter(runner)

23.7 easycv.hooks.eval_hook module

class easycv.hooks.eval_hook.**EvalHook**(dataloader, initial=False, interval=1, mode='test',
flush_buffer=True, **eval_kwargs)

Bases: `mmcv.runner.hooks.hook.Hook`

Evaluation hook.

dataloader

A PyTorch dataloader.

Type `DataLoader`

interval

Evaluation interval (by epochs). Default: 1.

Type `int`

mode

model forward mode

Type `str`

flush_buffer

flush log buffer

Type `bool`

__init__(dataloader, initial=False, interval=1, mode='test', flush_buffer=True, **eval_kwargs)

Initialize self. See help(type(self)) for accurate signature.

before_run(runner)

after_train_epoch(runner)

add_visualization_info(runner, results)

evaluate(runner, results)

class easycv.hooks.eval_hook.**DistEvalHook**(dataloader, interval=1, mode='test', initial=False,
gpu_collect=False, flush_buffer=True,
broadcast_bn_buffer=True, **eval_kwargs)

Bases: `easycv.hooks.eval_hook.EvalHook`

Distributed evaluation hook.

dataloader

A PyTorch dataloader.

Type `DataLoader`

interval

Evaluation interval (by epochs). Default: 1.

Type `int`

mode

model forward mode

Type `str`

tmpdir

Temporary directory to save the results of all processes. Default: None.

Type str | None

gpu_collect

Whether to use gpu or cpu to collect results. Default: False.

Type bool

broadcast_bn_buffer

Whether to broadcast the buffer(`running_mean` and `running_var`) of rank 0 to other rank before evaluation.
Default: True.

Type bool

__init__(*dataloader*, *interval=1*, *mode='test'*, *initial=False*, *gpu_collect=False*, *flush_buffer=True*, *broadcast_bn_buffer=True*, ***eval_kwargs*)

Initialize self. See help(type(self)) for accurate signature.

after_train_epoch(*runner*)

23.8 easycv.hooks.export_hook module

```
class easycv.hooks.export_hook.ExportHook(cfg, ckpt_filename_tmpl='epoch_{}.pth',
                                           export_ckpt_filename_tmpl='epoch_{}_export.pt',
                                           export_after_each_ckpt=False)
```

Bases: `mmcv.runner.hooks.hook.Hook`

export model when training on pai

__init__(*cfg*, *ckpt_filename_tmpl='epoch_{}.pth'*, *export_ckpt_filename_tmpl='epoch_{}_export.pt'*, *export_after_each_ckpt=False*)

Parameters

- **cfg** – config dict
- **ckpt_filename_tmpl** – checkpoint filename template

export_model(*runner*, *epoch*)

after_train_iter(*runner*)

after_train_epoch(*runner*)

after_run(*runner*)

23.9 easycv.hooks.extractor module

```
class easycv.hooks.extractor.Extractor(dataset, imgs_per_gpu, workers_per_gpu, dist_mode=False)
```

Bases: `object`

__init__(*dataset*, *imgs_per_gpu*, *workers_per_gpu*, *dist_mode=False*)

Initialize self. See help(type(self)) for accurate signature.

23.10 easycv.hooks.optimizer_hook module

```
class easycv.hooks.optimizer_hook.OptimizerHook(update_interval=1, grad_clip=None, coalesce=True,
                                                bucket_size_mb=- 1, ignore_key=[],
                                                ignore_key_epoch=[], multiply_key=[],
                                                multiply_rate=[])
```

Bases: `mmcv.runner.hooks.optimizer.OptimizerHook`

```
__init__(update_interval=1, grad_clip=None, coalesce=True, bucket_size_mb=- 1, ignore_key=[],
          ignore_key_epoch=[], multiply_key=[], multiply_rate=[])
    ignore_key: [str,...], ignore_key[i], name of parameters, which's gradient will be set to zero be-
    fore every optimizer step when epoch < ignore_key_epoch[i] ignore_key_epoch: [int,...], epoch < ig-
    nore_key_epoch[i], ignore_key[i]'s gradient will be set to zero. multiply_key:[str,...] multiply_key[i],
    name of parameters, which will set different learning rate ratio by multiply_rate multiply_rate:[float,...]
    multiply_rate[i], different ratio
```

```
skip_ignore_key(runner)
```

```
multiply_grad(runner)
```

```
adapt_torchacc(runner)
```

```
after_train_iter(runner)
```

```
class easycv.hooks.optimizer_hook.AMPFP16OptimizerHook(update_interval=1, grad_clip=None,
                                                         coalesce=True, bucket_size_mb=- 1,
                                                         ignore_key=[], ignore_key_epoch=[],
                                                         loss_scale={})
```

Bases: `easycv.hooks.optimizer_hook.OptimizerHook`

```
__init__(update_interval=1, grad_clip=None, coalesce=True, bucket_size_mb=- 1, ignore_key=[],
          ignore_key_epoch=[], loss_scale={})
    ignore_key: [str,...], ignore_key[i], name of parameters, which's gradient will be set to zero be-
    fore every optimizer step when epoch < ignore_key_epoch[i] ignore_key_epoch: [int,...], epoch < ig-
    nore_key_epoch[i], ignore_key[i]'s gradient will be set to zero. loss_scale (float | dict): grade scale config.
    If loss_scale is a float, static loss scaling will be used with the specified scale.
```

It can also be a dict containing arguments of GradScaler. For Pytorch >= 1.6, we use official `torch.cuda.amp.GradScaler`. please refer to: <https://pytorch.org/docs/stable/amp.html#torch.cuda.amp.GradScaler> for the parameters.

```
before_run(runner)
```

```
after_train_iter(runner)
```

23.11 easycv.hooks.oss_sync_hook module

```
class easycv.hooks.oss_sync_hook.OSSSyncHook(work_dir, oss_work_dir, interval=1,
                                              ckpt_filename_tmpl='epoch_{}.pth',
                                              export_ckpt_filename_tmpl='epoch_{}_export.pt',
                                              other_file_list=[], iter_interval=None)
```

Bases: `mmcv.runner.hooks.hook.Hook`

upload log files and checkpoints to oss when training on pai

```
__init__(work_dir, oss_work_dir, interval=1, ckpt_filename_tmpl='epoch_{}.pth',
          export_ckpt_filename_tmpl='epoch_{}_export.pt', other_file_list=[], iter_interval=None)
```

Parameters

- **work_dir** – work_dir in cfg
- **oss_work_dir** – oss directory where to upload local files in work_dir
- **interval** – upload frequency
- **ckpt_filename_tmpl** – checkpoint filename template
- **other_file_list** – other file need to be upload to oss
- **iter_interval** – upload frequency by iter interval, default to be None, means do it with certain assignment

upload_file(runner)

after_train_iter(runner)

after_train_epoch(runner)

after_run(runner)

23.12 easycv.hooks.registry module

23.13 easycv.hooks.show_time_hook module

class easycv.hooks.show_time_hook.TIMEHook(end_momentum=1.0, **kwargs)

Bases: mmcv.runner.hooks.hook.Hook

This hook to show time for runner running process

__init__(end_momentum=1.0, **kwargs)

Initialize self. See help(type(self)) for accurate signature.

before_train_iter(runner)

after_train_iter(runner)

23.14 easycv.hooks.swav_hook module

class easycv.hooks.swav_hook.SWAVHook(gpu_batch_size=32, dump_path='data', **kwargs)

Bases: mmcv.runner.hooks.hook.Hook

Hook in SWAV

__init__(gpu_batch_size=32, dump_path='data', **kwargs)

Initialize self. See help(type(self)) for accurate signature.

before_run(runner)

before_train_epoch(runner)

after_train_epoch(runner)

23.15 easycv.hooks.sync_norm_hook module

`easycv.hooks.sync_norm_hook.get_norm_states(module)`

class `easycv.hooks.sync_norm_hook.SyncNormHook`(*no_aug_epochs=15, interval=1, **kwargs*)

Bases: `mmcv.runner.hooks.hook.Hook`

Synchronize Norm states after training epoch, currently used in YOLOX.

Parameters

- **no_aug_epochs** (*int*) – The number of latter epochs in the end of the training to switch to synchronizing norm interval. Default: 15.
- **interval** (*int*) – Synchronizing norm interval. Default: 1.

__init__(*no_aug_epochs=15, interval=1, **kwargs*)

Initialize self. See `help(type(self))` for accurate signature.

before_train_epoch(*runner*)

after_train_epoch(*runner*)

Synchronizing norm.

23.16 easycv.hooks.sync_random_size_hook module

class `easycv.hooks.sync_random_size_hook.SyncRandomSizeHook`(*ratio_range=(14, 26),
img_scale=(640, 640), interval=10,
device='cuda', **kwargs*)

Bases: `mmcv.runner.hooks.hook.Hook`

Change and synchronize the random image size across ranks, currently used in YOLOX.

Parameters

- **ratio_range** (*tuple[int]*) – Random ratio range. It will be multiplied by 32, and then change the dataset output image size. Default: (14, 26).
- **img_scale** (*tuple[int]*) – Size of input image. Default: (640, 640).
- **interval** (*int*) – The interval of change image size. Default: 10.
- **device** (*torch.device | str*) – device for returned tensors. Default: 'cuda'.

__init__(*ratio_range=(14, 26), img_scale=(640, 640), interval=10, device='cuda', **kwargs*)

Initialize self. See `help(type(self))` for accurate signature.

after_train_iter(*runner*)

Change the dataset output image size.

23.17 easycv.hooks.tensorboard module

```
class easycv.hooks.tensorboard.TensorboardLoggerHookV2(log_dir=None, interval=10,
                                                    ignore_last=True, reset_flag=False,
                                                    by_epoch=True)

Bases: mmcv.runner.hooks.logger.tensorboard.TensorboardLoggerHook

visualization_log(runner)
    Images Visualization. visualization_buffer is a dictionary containing:

        images (list): list of visualized images. img metas (list of dict, optional): dict containing
        ori_filename and so on.

        ori_filename will be displayed as the tag of the image by default.

log(runner)

after_train_iter(runner)
```

23.18 easycv.hooks.wandb module

```
class easycv.hooks.wandb.WandbLoggerHookV2(init_kwargs=None, interval=10, ignore_last=True,
                                           reset_flag=False, commit=True, by_epoch=True,
                                           with_step=True)

Bases: mmcv.runner.hooks.logger.wandb.WandbLoggerHook

visualization_log(runner)
    Images Visualization. visualization_buffer is a dictionary containing:

        images (list): list of visualized images. img metas (list of dict, optional): dict containing
        ori_filename and so on.

        ori_filename will be displayed as the tag of the image by default.

log(runner)

after_train_iter(runner)
```

23.19 easycv.hooks.yolox_lr_hook module

```
class easycv.hooks.yolox_lr_hook.YOLOXLRUpdaterHook(num_last_epochs, **kwargs)

Bases: mmcv.runner.hooks.lr_updater.CosineAnnealingLRUpdaterHook

YOLOX learning rate scheme.

There are two main differences between YOLOXLRUpdaterHook and CosineAnnealingLRUpdaterHook.

1. When the current running epoch is greater than max_epoch-last_epoch, a fixed learning rate will be
   used

2. The exp warmup scheme is different with LRUpdaterHook in MMCV

Parameters num_last_epochs (int) – The number of epochs with a fixed learning rate before
the end of the training.

__init__(num_last_epochs, **kwargs)
    Initialize self. See help(type(self)) for accurate signature.
```

```
get_warmup_lr(cur_iters)
```

```
get_lr(runner, base_lr)
```

23.20 easycv.hooks.yolox_mode_switch_hook module

```
class easycv.hooks.yolox_mode_switch_hook.YOLOXModeSwitchHook(no_aug_epochs=15,  
                                                             skip_type_keys=('MMMosaic',  
                                                             'MMRandomAffine', 'MMMixUp'),  
                                                             **kwargs)
```

Bases: `mmcv.runner.hooks.hook.Hook`

Switch the mode of YOLOX during training.

This hook turns off the mosaic and mixup data augmentation and switches to use L1 loss in `bbox_head`.

Parameters `no_aug_epochs` – The number of latter epochs in the end of the training to close the data augmentation and switch to L1 loss. Default: 15.

`__init__`(*no_aug_epochs*=15, *skip_type_keys*=('MMMosaic', 'MMRandomAffine', 'MMMixUp'), ***kwargs*)
Initialize self. See `help(type(self))` for accurate signature.

`before_train_epoch`(*runner*)

Close mosaic and mixup augmentation and switches to use L1 loss.

EASYCV.PREDICTORS PACKAGE

24.1 Submodules

24.2 easycv.predictors.base module

class easycv.predictors.base.NumpyToPIL

Bases: object

class easycv.predictors.base.Predictor(model_path, numpy_to_pil=True)

Bases: object

__init__(model_path, numpy_to_pil=True)

Initialize self. See help(type(self)) for accurate signature.

preprocess(image_list)

predict_batch(image_batch, **forward_kwargs)

predict using batched data :param image_batch: tensor with shape [N, 3, H, W] :type image_batch: torch.Tensor :param forward_kwargs: kwargs for additional parameters

Returns the output of model.forward, list or tuple

Return type output

class easycv.predictors.base.InputProcessor(cfg, pipelines=None, batch_size=1, threads=8, mode='BGR')

Bases: object

Base input processor for processing input samples. :param cfg: Config instance. :type cfg: Config :param pipelines: Data pipeline configs. :type pipelines: list[dict] :param batch_size: batch size for forward. :type batch_size: int :param threads: Number of processes to process inputs. :type threads: int :param mode: The image mode into the model. :type mode: str

__init__(cfg, pipelines=None, batch_size=1, threads=8, mode='BGR')

Initialize self. See help(type(self)) for accurate signature.

build_processor()

Build processor to process loaded input. If you need custom preprocessing ops, you need to reimplement it.

process_single(input)

Process single input sample. If you need custom ops to load or process a single input sample, you need to reimplement it.

class easycv.predictors.base.OutputProcessor

Bases: object

Base output processor for processing model outputs.

__init__()

Initialize self. See help(type(self)) for accurate signature.

process_single(inputs)

Process outputs of single sample. If you need add some processing ops, you need to reimplement it.

```
class easycv.predictors.base.PredictorV2(model_path, config_file=None, batch_size=1, device=None,
                                         save_results=False, save_path=None, pipelines=None,
                                         input_processor_threads=8, mode='BGR')
```

Bases: object

Base predict pipeline. :param model_path: Path of model path. :type model_path: str :param config_file: config file path for model and processor to init. Defaults to None. :type config_file: Optional[str] :param batch_size: batch size for forward. :type batch_size: int :param device: Support str('cuda' or 'cpu') or torch.device, if is None, detect device automatically. :type device: str | torch.device :param save_results: Whether to save predict results. :type save_results: bool :param save_path: File path for saving results, only valid when *save_results* is True. :type save_path: str :param pipelines: Data pipeline configs. :type pipelines: list[dict] :param input_processor_threads: Number of processes to process inputs. :type input_processor_threads: int :param mode: The image mode into the model. :type mode: str

__init__(model_path, config_file=None, batch_size=1, device=None, save_results=False, save_path=None, pipelines=None, input_processor_threads=8, mode='BGR')

Initialize self. See help(type(self)) for accurate signature.

get_input_processor()

get_output_processor()

prepare_model()

Build model from config file by default. If the model is not loaded from a configuration file, e.g. torch jit model, you need to reimplement it.

model_forward(inputs)

Model forward. If you need refactor model forward, you need to reimplement it.

dump(obj, save_path, mode='wb')

24.3 easycv.predictors.builder module

```
easycv.predictors.builder.build_predictor(cfg, default_args=None)
```

24.4 easycv.predictors.classifier module

```
class easycv.predictors.classifier.ClsInputProcessor(cfg, pipelines=None, batch_size=1,
                                                    pil_input=True, threads=8, mode='BGR')
```

Bases: [easycv.predictors.base.InputProcessor](#)

Process inputs for classification models.

Parameters

- **cfg** (*Config*) – Config instance.
- **pipelines** (*list[dict]*) – Data pipeline configs.
- **batch_size** (*int*) – batch size for forward.

- **pil_input** (*bool*) – Whether use PIL image. If processor need PIL input, set true, default false.
- **threads** (*int*) – Number of processes to process inputs.
- **mode** (*str*) – The image mode into the model.

__init__ (*cfg, pipelines=None, batch_size=1, pil_input=True, threads=8, mode='BGR'*)
Initialize self. See help(type(self)) for accurate signature.

class easycv.predictors.classifier.ClsOutputProcessor(*topk=1, label_map={}*)
Bases: [easycv.predictors.base.OutputProcessor](#)

Output processor for processing classification model outputs.

Parameters

- **topk** (*int*) – Return top-k results. Default: 1.
- **label_map** (*dict*) – Dict of class id to class name.

__init__ (*topk=1, label_map={}*)
Initialize self. See help(type(self)) for accurate signature.

class easycv.predictors.classifier.ClassificationPredictor(*model_path, config_file=None, batch_size=1, device=None, save_results=False, save_path=None, pipelines=None, topk=1, pil_input=True, label_map_path=None, input_processor_threads=8, mode='BGR', *args, **kwargs*)

Bases: [easycv.predictors.base.PredictorV2](#)

Predictor for classification. :param model_path: Path of model path. :type model_path: str :param config_file: config file path for model and processor to init. Defaults to None. :type config_file: Optional[str] :param batch_size: batch size for forward. :type batch_size: int :param device: Support 'cuda' or 'cpu', if is None, detect device automatically. :type device: str :param save_results: Whether to save predict results. :type save_results: bool :param save_path: File path for saving results, only valid when *save_results* is True. :type save_path: str :param pipelines: Data pipeline configs. :type pipelines: list[dict] :param topk: Return top-k results. Default: 1. :type topk: int :param pil_input: Whether use PIL image. If processor need PIL input, set true, default false. :type pil_input: bool :param label_map_path: File path of saving labels list. :type label_map_path: str :param input_processor_threads: Number of processes to process inputs. :type input_processor_threads: int :param mode: The image mode into the model. :type mode: str

__init__ (*model_path, config_file=None, batch_size=1, device=None, save_results=False, save_path=None, pipelines=None, topk=1, pil_input=True, label_map_path=None, input_processor_threads=8, mode='BGR', *args, **kwargs*)

Initialize self. See help(type(self)) for accurate signature.

get_input_processor()

get_output_processor()

24.5 easycv.predictors.detector module

`easycv.predictors.detector.onnx_to_numpy(tensor)`

class `easycv.predictors.detector.DetInputProcessor(cfg, pipelines=None, batch_size=1, threads=8, mode='BGR')`

Bases: `easycv.predictors.base.InputProcessor`

build_processor()

Build processor to process loaded input. If you need custom preprocessing ops, you need to reimplement it.

class `easycv.predictors.detector.DetOutputProcessor(score_thresh, classes=None)`

Bases: `easycv.predictors.base.OutputProcessor`

__init__(score_thresh, classes=None)

Initialize self. See help(type(self)) for accurate signature.

process_single(inputs)

Process outputs of single sample. If you need add some processing ops, you need to reimplement it.

class `easycv.predictors.detector.DetectionPredictor(model_path, config_file=None, batch_size=1, device=None, save_results=False, save_path=None, pipelines=None, score_threshold=0.5, input_processor_threads=8, mode='BGR', *arg, **kwargs)`

Bases: `easycv.predictors.base.PredictorV2`

Generic Detection Predictor, it will filter bbox results by `score_threshold`.

Parameters

- **model_path** (*str*) – Path of model path.
- **config_file** (*Optional[str]*) – config file path for model and processor to init. Defaults to None.
- **batch_size** (*int*) – batch size for forward.
- **device** (*str* | *torch.device*) – Support str('cuda' or 'cpu') or torch.device, if is None, detect device automatically.
- **save_results** (*bool*) – Whether to save predict results.
- **save_path** (*str*) – File path for saving results, only valid when `save_results` is True.
- **pipelines** (*list[dict]*) – Data pipeline configs.
- **input_processor_threads** (*int*) – Number of processes to process inputs.
- **mode** (*str*) – The image mode into the model.

__init__(model_path, config_file=None, batch_size=1, device=None, save_results=False, save_path=None, pipelines=None, score_threshold=0.5, input_processor_threads=8, mode='BGR', *arg, **kwargs)

Initialize self. See help(type(self)) for accurate signature.

get_input_processor()

get_output_processor()

visualize(img, results, show=False, out_file=None)

Only support show one sample now.

```
class easycv.predictors.detector.YoloXInputProcessor(cfg, pipelines=None, batch_size=1,  
                                                    model_type='raw', jit_processor_path=None,  
                                                    device=None, threads=8, mode='BGR')
```

Bases: [easycv.predictors.detector.DetInputProcessor](#)

Input processor for yolox.

Parameters

- **cfg** (*Config*) – Config instance.
- **pipelines** (*list[dict]*) – Data pipeline configs.
- **batch_size** (*int*) – batch size for forward.
- **model_type** (*str*) – “raw” or “jit” or “blade”
- **jit_processor_path** (*str*) – File of the saved processing operator of torch jit type.
- **device** (*str* / *torch.device*) – Support str(‘cuda’ or ‘cpu’) or torch.device, if is None, detect device automatically.
- **threads** (*int*) – Number of processes to process inputs.
- **mode** (*str*) – The image mode into the model.

```
__init__(cfg, pipelines=None, batch_size=1, model_type='raw', jit_processor_path=None, device=None,  
         threads=8, mode='BGR')
```

Initialize self. See help(type(self)) for accurate signature.

build_processor()

Build processor to process loaded input. If you need custom preprocessing ops, you need to reimplement it.

```
class easycv.predictors.detector.YoloXOutputProcessor(score_thresh=0.5, model_type='raw',  
                                                    test_conf=0.01, nms_thre=0.65,  
                                                    use_trt_efficientnms=False, classes=None)
```

Bases: [easycv.predictors.detector.DetOutputProcessor](#)

```
__init__(score_thresh=0.5, model_type='raw', test_conf=0.01, nms_thre=0.65, use_trt_efficientnms=False,  
         classes=None)
```

Initialize self. See help(type(self)) for accurate signature.

```
post_assign(outputs, img metas)
```

```
process_single(inputs)
```

Process outputs of single sample. If you need add some processing ops, you need to reimplement it.

```
class easycv.predictors.detector.YoloXPredictor(model_path, config_file=None, batch_size=1,  
                                              use_trt_efficientnms=False, device=None,  
                                              save_results=False, save_path=None,  
                                              pipelines=None, max_det=100, score_thresh=0.5,  
                                              nms_thresh=None, test_conf=None,  
                                              input_processor_threads=8, mode='BGR',  
                                              model_type=None)
```

Bases: [easycv.predictors.detector.DetectionPredictor](#)

Detection predictor for Yolox.

Parameters

- **model_path** (*str*) – Path of model path.

- **config_file** (*Optional[str]*) – config file path for model and processor to init. Defaults to None.
- **batch_size** (*int*) – batch size for forward.
- **use_trt_efficientnms** (*bool*) – Whether used tensorrt efficient nms operation in the saved model.
- **device** (*str* / *torch.device*) – Support str('cuda' or 'cpu') or torch.device, if is None, detect device automatically.
- **save_results** (*bool*) – Whether to save predict results.
- **save_path** (*str*) – File path for saving results, only valid when *save_results* is True.
- **pipelines** (*list[dict]*) – Data pipeline configs.
- **max_det** (*int*) – Maximum number of detection output boxes.
- **score_thresh** (*float*) – Score threshold to filter box.
- **nms_thresh** (*float*) – Nms threshold to filter box.
- **input_processor_threads** (*int*) – Number of processes to process inputs.
- **mode** (*str*) – The image mode into the model.

```
__init__(model_path, config_file=None, batch_size=1, use_trt_efficientnms=False, device=None,
         save_results=False, save_path=None, pipelines=None, max_det=100, score_thresh=0.5,
         nms_thresh=None, test_conf=None, input_processor_threads=8, mode='BGR',
         model_type=None)
```

Initialize self. See help(type(self)) for accurate signature.

prepare_model()

Build model from config file by default. If the model is not loaded from a configuration file, e.g. torch jit model, you need to reimplement it.

model_forward(inputs)

Model forward. If you need refactor model forward, you need to reimplement it.

get_input_processor()

get_output_processor()

class easycv.predictors.detector.**TorchFaceDetector**(*model_path=None, model_config=None*)

Bases: [easycv.predictors.interface.PredictorInterface](#)

```
__init__(model_path=None, model_config=None)
```

init model, add a facedetect and align for img input.

Parameters

- **model_path** – model file path
- **model_config** – config string for model to init, in json format

get_output_type()

in this function user should return a type dict, which indicates which type of data should the output of predictor be converted to * type json, data will be serialized to json str

- type image, data will be converted to encode image binary and write to oss file, whose name is output_dir/{key}/{input_filename}_{idx}.jpg, where input_filename is the base filename extracted from url, key corresponds to the key in the dict of output_type, if the type of data indexed by key is a list, idx is the index of element in list, otherwise {idx} will be empty
- type video, data will be converted to encode video binary and write to oss file,

```
:: return { 'image': 'image', 'feature': 'json' }
```

} indicating that the image data in the output dict will be save to image file and feature in output dict will be converted to json

```
batch(image_tensor_list)
```

```
predict(input_data_list, batch_size=- 1, threshold=0.95)
```

using session run predict a number of samples using batch_size

Parameters

- **input_data_list** – a list of numpy array, each array is a sample to be predicted
- **batch_size** – batch_size passed by the caller, you can also ignore this param and use a fixed number if you do not want to adjust batch_size in runtime

Returns

a list of dict, each dict is the prediction result of one sample eg, {"output1": value1, "output2": value2}, the value type can be python int str float, and numpy array

Return type result

Raises if detect !=1 face in a img, then do nothing for this image –

```
class easycv.predictors.detector.TorchYoloXClassifierPredictor(models_root_dir, max_det=100,
                                                             cls_score_thresh=0.01,
                                                             det_model_config=None,
                                                             cls_model_config=None)
```

Bases: [easycv.predictors.interface.PredictorInterface](#)

```
__init__(models_root_dir, max_det=100, cls_score_thresh=0.01, det_model_config=None,
         cls_model_config=None)
```

init model, add a yolox and classification predictor for img input.

Parameters

- **models_root_dir** – models_root_dir/detection/.pth and models_root_dir/classification/.pth
- **det_model_config** – config string for detection model to init, in json format
- **cls_model_config** – config string for classification model to init, in json format

```
predict(input_data_list, batch_size=- 1)
```

using session run predict a number of samples using batch_size

Parameters

- **input_data_list** – a list of numpy array(in rgb order), each array is a sample to be predicted
- **batch_size** – batch_size passed by the caller, you can also ignore this param and use a fixed number if you do not want to adjust batch_size in runtime

Returns

a list of dict, each dict is the prediction result of one sample eg, {"output1": value1, "output2": value2}, the value type can be python int str float, and numpy array

Return type result

24.6 easycv.predictors.feature_extractor module

```
class easycv.predictors.feature_extractor.TorchFeatureExtractor(model_path,  
                                                             model_config=None)
```

Bases: *easycv.predictors.interface.PredictorInterface*

```
__init__(model_path, model_config=None)  
    init model
```

Parameters

- **model_path** – model file path
- **model_config** – config string for model to init, in json format

```
get_output_type()
```

in this function user should return a type dict, which indicates which type of data should the output of predictor be converted to * type json, data will be serialized to json str

- type image, data will be converted to encode image binary and write to oss file, whose name is output_dir/\${key}/\${input_filename}_\${idx}.jpg, where input_filename is the base filename extracted from url, key corresponds to the key in the dict of output_type, if the type of data indexed by key is a list, idx is the index of element in list, otherwise \${idx} will be empty
- type video, data will be converted to encode video binary and write to oss file,

```
:: return { 'image': 'image', 'feature': 'json' }
```

} indicating that the image data in the output dict will be save to image file and feature in output dict will be converted to json

```
batch(image_tensor_list)
```

```
predict(input_data_list, batch_size=-1)
```

using session run predict a number of samples using batch_size

Parameters

- **input_data_list** – a list of numpy array, each array is a sample to be predicted
- **batch_size** – batch_size passed by the caller, you can also ignore this param and use a fixed number if you do not want to adjust batch_size in runtime

Returns

a list of dict, each dict is the prediction result of one sample eg, {"output1": value1, "output2": value2}, the value type can be python int str float, and numpy array

Return type result

```
class easycv.predictors.feature_extractor.TorchFaceFeatureExtractor(model_path,  
                                                                    model_config=None)
```

Bases: *easycv.predictors.interface.PredictorInterface*

```
__init__(model_path, model_config=None)  
    init model, add a facedetect and align for img input.
```

Parameters

- **model_path** – model file path
- **model_config** – config string for model to init, in json format

get_output_type()

in this function user should return a type dict, which indicates which type of data should the output of predictor be converted to * type json, data will be serialized to json str

- type image, data will be converted to encode image binary and write to oss file, whose name is output_dir/{key}/{input_filename}_{idx}.jpg, where input_filename is the base filename extracted from url, key corresponds to the key in the dict of output_type, if the type of data indexed by key is a list, idx is the index of element in list, otherwise \${idx} will be empty
- type video, data will be converted to encode video binary and write to oss file,

```
:: return { 'image': 'image', 'feature': 'json' }
```

} indicating that the image data in the output dict will be save to image file and feature in output dict will be converted to json

batch(image_tensor_list)**predict(input_data_list, batch_size=- 1, detect_and_align=True)**

using session run predict a number of samples using batch_size

Parameters

- **input_data_list** – a list of numpy array or PIL.Image, each array is a sample to be predicted
- **batch_size** – batch_size passed by the caller, you can also ignore this param and use a fixed number if you do not want to adjust batch_size in runtime
- **detect_and_align** – True to detect and align before feature extractor

Returns

a list of dict, each dict is the prediction result of one sample eg, {"output1": value1, "output2": value2}, the value type can be python int str float, and numpy array

Return type result

Raises if detect !=1 face in a img, then do nothing for this image –

```
class easycv.predictors.feature_extractor.TorchMultiFaceFeatureExtractor(model_path,
                                                                    model_config=None)
```

Bases: [easycv.predictors.interface.PredictorInterface](#)

```
__init__(model_path, model_config=None)
```

init model, add a facedetect and align for img input.

Parameters

- **model_path** – model file path
- **model_config** – config string for model to init, in json format

get_output_type()

in this function user should return a type dict, which indicates which type of data should the output of predictor be converted to * type json, data will be serialized to json str

- type image, data will be converted to encode image binary and write to oss file, whose name is output_dir/{key}/{input_filename}_{idx}.jpg, where input_filename is the base filename extracted from url, key corresponds to the key in the dict of output_type, if the type of data indexed by key is a list, idx is the index of element in list, otherwise \${idx} will be empty
- type video, data will be converted to encode video binary and write to oss file,

```
:: return { 'image': 'image', 'feature': 'json'}
```

} indicating that the image data in the output dict will be save to image file and feature in output dict will be converted to json

batch(*image_tensor_list*)

predict(*input_data_list*, *batch_size=-1*, *detect_and_align=True*)
using session run predict a number of samples using batch_size

Parameters

- **input_data_list** – a list of numpy array or PIL.Image, each array is a sample to be predicted
- **batch_size** – batch_size passed by the caller, you can also ignore this param and use a fixed number if you do not want to adjust batch_size in runtime
- **detect_and_align** – True to detect and align before feature extractor

Returns

a list of dict, each dict is the prediction result of one sample eg, {"output1": value1, "output2": value2}, the value type can be python int str float, and numpy array

Return type result

Raises if detect !=1 face in a img, then do nothing for this image –

```
class easycv.predictors.feature_extractor.TorchFaceAttrExtractor(model_path,
                                                                model_config=None,
                                                                face_threshold=0.95,
                                                                attr_method=['distribute_sum',
                                                                'softmax', 'softmax'],
                                                                attr_name=['age', 'gender',
                                                                'emo'])
```

Bases: [easycv.predictors.interface.PredictorInterface](#)

```
__init__(model_path, model_config=None, face_threshold=0.95, attr_method=['distribute_sum', 'softmax',
                                                                'softmax'], attr_name=['age', 'gender', 'emo'])
init model
```

Parameters

- **model_path** – model file path
- **model_config** – config string for model to init, in json format
- **attr_method** –
 - softmax: do softmax for feature_dim 1
 - distribute_sum: do softmax and prob sum

get_output_type()

in this function user should return a type dict, which indicates which type of data should the output of predictor be converted to * type json, data will be serialized to json str

- type image, data will be converted to encode image binary and write to oss file, whose name is output_dir/\${key}/\${input_filename}_\${idx}.jpg, where input_filename is the base filename extracted from url, key corresponds to the key in the dict of output_type, if the type of data indexed by key is a list, idx is the index of element in list, otherwhile \${idx} will be empty
- type video, data will be converted to encode video binary and write to oss file,

```
:: return { 'image': 'image', 'feature': 'json'}
```

} indicating that the image data in the output dict will be save to image file and feature in output dict will be converted to json

```
batch(image_tensor_list)
```

```
predict(input_data_list, batch_size=- 1)
```

using session run predict a number of samples using batch_size

Parameters

- **input_data_list** – a list of numpy array, each array is a sample to be predicted
- **batch_size** – batch_size passed by the caller, you can also ignore this param and use a fixed number if you do not want to adjust batch_size in runtime

Returns

a list of dict, each dict is the prediction result of one sample eg, {"output1": value1, "output2": value2}, the value type can be python int str float, and numpy array

Return type result

24.7 easycv.predictors.interface module

```
class easycv.predictors.interface.PredictorInterface(model_path, model_config=None)
```

Bases: object

```
version = 1
```

```
__init__(model_path, model_config=None)
```

init model

Parameters

- **model_path** – init model from this directory
- **model_config** – config string for model to init, in json format

```
abstract predict(input_data, batch_size)
```

using session run predict a number of samples using batch_size

Parameters

- **input_data** – a list of numpy array, each array is a sample to be predicted
- **batch_size** – batch_size passed by the caller, you can also ignore this param and use a fixed number if you do not want to adjust batch_size in runtime

Returns

a list of dict, each dict is the prediction result of one sample eg, {"output1": value1, "output2": value2}, the value type can be python int str float, and numpy array

Return type result

```
get_output_type()
```

in this function user should return a type dict, which indicates which type of data should the output of predictor be converted to * type json, data will be serialized to json str

- type image, data will be converted to encode image binary and write to oss file, whose name is output_dir/{key}/{input_filename}_{idx}.jpg, where input_filename is extracted from url, key corresponds to the key in the dict of output_type, if the type of data indexed by key is a list, idx is the index of element in list, otherwise {idx} will be empty
- type video, data will be converted to encode video binary and write to oss file,

```
:: return { 'image': 'image', 'feature': 'json' }
```

} indicating that the image data in the output dict will be save to image file and feature in output dict will be converted to json

```
class easycv.predictors.interface.PredictorInterfaceV2(model_path, model_config=None)
```

Bases: [easycv.predictors.interface.PredictorInterface](#)

version = 2

```
__init__(model_path, model_config=None)
```

init model

Parameters

- **model_path** – init model from this directory
- **model_config** – config string for model to init, in json format

```
get_output_type()
```

in this function user should return a type dict, which indicates which type of data should the output of predictor be converted to * type json, data will be serialized to json str

- type image, data will be converted to encode image binary and write to oss file, whose name is output_dir/{key}/{input_filename}_{idx}.jpg, where input_filename is the base filename extracted from url, key corresponds to the key in the dict of output_type, if the type of data indexed by key is a list, idx is the index of element in list, otherwise {idx} will be empty
- type video, data will be converted to encode video binary and write to oss file,

```
:: return { 'image': 'image', 'feature': 'json' }
```

} indicating that the image data in the output dict will be save to image file and feature in output dict will be converted to json

```
abstract predict(input_data_dict_list, batch_size)
```

using session run predict a number of samples using batch_size

Parameters

- **input_data_dict_list** – a list of dict, each dict is a sample data to be predicted
- **batch_size** – batch_size passed by the caller, you can also ignore this param and use a fixed number if you do not want to adjust batch_size in runtime

Returns

a list of dict, each dict is the prediction result of one sample eg, {"output1": value1, "output2": value2}, the value type can be python int str float, and numpy array

Return type result

24.8 easycv.predictors.pose_predictor module

```
easycv.predictors.pose_predictor.vis_pose_result(model, img, result, radius=4, thickness=1,
                                                kpt_score_thr=0.3, bbox_color='green',
                                                dataset_info=None, out_file=None,
                                                pose_kpt_color=None, pose_link_color=None,
                                                text_color='white', font_scale=0.5,
                                                bbox_thickness=1, win_name='', show=False,
                                                wait_time=0)
```

Visualize the detection results on the image.

Parameters

- **model** (*nn.Module*) – The loaded detector.
- **img** (*str* | *np.ndarray*) – Image filename or loaded image.
- **result** (*list[dict]*) – The results to draw over *img* (bbox_result, pose_result).
- **radius** (*int*) – Radius of circles.
- **thickness** (*int*) – Thickness of lines.
- **kpt_score_thr** (*float*) – The threshold to visualize the keypoints.
- **skeleton** (*list[tuple()]*) – Default None.
- **out_file** (*str* or *None*) – The filename of the output visualization image.
- **show** (*bool*) – Whether to show the image. Default: False.
- **wait_time** (*int*) – Value of waitKey param. Default: 0.
- **out_file** – The filename to write the image. Default: None.

```
class easycv.predictors.pose_predictor.PoseTopDownInputProcessor(cfg, dataset_info,
                                                                detection_predictor_config,
                                                                bbox_thr=None,
                                                                pipelines=None, batch_size=1,
                                                                cat_id=None, mode='BGR')
```

Bases: [easycv.predictors.base.InputProcessor](#)

```
__init__(cfg, dataset_info, detection_predictor_config, bbox_thr=None, pipelines=None, batch_size=1,
         cat_id=None, mode='BGR')
```

Initialize self. See help(type(self)) for accurate signature.

```
get_detection_outputs(input, cat_id=None)
```

```
process_single(input)
```

Process single input sample. If you need custom ops to load or process a single input sample, you need to reimplement it.

```
class easycv.predictors.pose_predictor.PoseTopDownOutputProcessor
```

Bases: [easycv.predictors.base.OutputProcessor](#)

```
class easycv.predictors.pose_predictor.PoseTopDownPredictor(model_path, config_file=None,
                                                            detection_predictor_config=None,
                                                            batch_size=1, bbox_thr=None,
                                                            cat_id=None, device=None,
                                                            pipelines=None, save_results=False,
                                                            save_path=None, mode='BGR',
                                                            model_type=None, *args, **kwargs)
```

Bases: [easycv.predictors.base.PredictorV2](#)

Pose topdown predictor. :param model_path: Path of model path. :type model_path: str :param config_file: Config file path for model and processor to init. Defaults to None. :type config_file: Optional[str] :param detection_model_config: Dict of person detection model predictor config,

example like dict(type="", model_path="", config_file="",)

Parameters

- **batch_size** (*int*) – Batch size for forward.
- **bbox_thr** (*float*) – Bounding box threshold to filter output results of detection model
- **cat_id** (*int* | *str*) – Category id or name to filter target objects.
- **device** (*str* | *torch.device*) – Support str('cuda' or 'cpu') or torch.device, if is None, detect device automatically.
- **save_results** (*bool*) – Whether to save predict results.
- **save_path** (*str*) – File path for saving results, only valid when *save_results* is True.
- **pipelines** (*list[dict]*) – Data pipeline configs.
- **mode** (*str*) – The image mode into the model.

```
__init__(model_path, config_file=None, detection_predictor_config=None, batch_size=1, bbox_thr=None,
          cat_id=None, device=None, pipelines=None, save_results=False, save_path=None, mode='BGR',
          model_type=None, *args, **kwargs)
```

Initialize self. See help(type(self)) for accurate signature.

prepare_model()

Build model from config file by default. If the model is not loaded from a configuration file, e.g. torch jit model, you need to reimplement it.

model_forward(inputs, return_heatmap=False)

Model forward. If you need refactor model forward, you need to reimplement it.

get_input_processor()

get_output_processor()

```
show_result(image, keypoints, radius=4, thickness=3, kpt_score_thr=0.3, bbox_color='green', show=False,
              save_path=None)
```

EASYCV.CORE PACKAGE

25.1 Subpackages

25.1.1 easycv.core.evaluation package

Subpackages

easycv.core.evaluation.custom_cocotools package

Submodules

easycv.core.evaluation.custom_cocotools.cocoeval module

class easycv.core.evaluation.custom_cocotools.cocoeval.COCOeval(*cocoGt=None, cocoDt=None, iouType='segm', sigmas=None*)

Bases: object

__init__(*cocoGt=None, cocoDt=None, iouType='segm', sigmas=None*)

Initialize CocoEval using coco APIs for gt and dt :param cocoGt: coco object with ground truth annotations :param cocoDt: coco object with detection results :param iouType: type of iou to be computed, bbox for detection task,

segm for segmentation task

Parameters **sigmas** – keypoint labelling sigmas.

Returns None

evaluate()

Run per image evaluation on given images and store results (a list of dict) in self.evalImgs :returns: None

computeIoU(*imgId, catId*)

computeOks(*imgId, catId*)

evaluateImg(*imgId, catId, aRng, maxDet*)

perform evaluation for single category and image :param imgId: image id, string :param catId: category id, string :param aRng: area range, tuple :param maxDet: maximum detection number

Returns dict (single image results)

accumulate(*p=None*)

Accumulate per image evaluation results and store the result in self.eval :param param p: input params for evaluation

Returns None

summarize()

Compute and display summary metrics for evaluation results. Note this function can *only* be applied on the default parameter setting

summarize_per_category()

Compute and display summary metrics for evaluation results *per category*. Note this function can *only* be applied on the default parameter setting

filter_annotations()(*annotations, catIds*)

makeplot(*recThrs, precisions, name, save_dir=None*)

analyze()

Analyze errors

class easycv.core.evaluation.custom_cocotools.cocoeval.Params(*iouType='segm'*)

Bases: object

Params for coco evaluation api

setDetParams()

setKpParams()

__init__(*iouType='segm'*)

Initialize self. See help(type(self)) for accurate signature.

Submodules

easycv.core.evaluation.ap module

easycv.core.evaluation.auc_eval module

class easycv.core.evaluation.auc_eval.AucEvaluator(*dataset_name=None,*
metric_names=['neck_auc'], neck_num=None)

Bases: [easycv.core.evaluation.base_evaluator.Evaluator](#)

AUC evaluator for binary classification only.

__init__(*dataset_name=None, metric_names=['neck_auc'], neck_num=None*)

Parameters

- **dataset_name** – eval dataset name
- **metric_names** – eval metrics name
- **neck_num** – some model contains multi-neck to support multitask, neck_num means use the no.neck_num neck output of model to eval

easycv.core.evaluation.base_evaluator module

class easycv.core.evaluation.base_evaluator.**Evaluator**(*dataset_name=None, metric_names=[]*)

Bases: object

Evaluator interface

__init__(*dataset_name=None, metric_names=[]*)

Construct eval ops from tensor

Parameters

- **dataset_name** (*str*) – dataset name to be evaluated
- **metric_names** (*List[str]*) – metric names this evaluator will return

evaluate(*prediction_dict, groundtruth_dict, **kwargs*)

property **metric_names**

easycv.core.evaluation.builder module

easycv.core.evaluation.builder.build_evaluator(*evaluator_cfg_list*)

build evaluator according to metric name

Parameters **evaluator_cfg_list** – list of evaluator config dict

Returns return a list of evaluator

easycv.core.evaluation.classification_eval module

class easycv.core.evaluation.classification_eval.**ClsEvaluator**(*topk=(1, 5), dataset_name=None, metric_names=['neck_top1'], neck_num=None, class_list=None*)

Bases: [easycv.core.evaluation.base_evaluator.Evaluator](#)

Classification evaluator.

__init__(*topk=(1, 5), dataset_name=None, metric_names=['neck_top1'], neck_num=None, class_list=None*)

Parameters

- **top_k** (*int, tuple*) – int or tuple of int, evaluate top_k acc
- **dataset_name** – eval dataset name
- **metric_names** – eval metrics name
- **neck_num** – some model contains multi-neck to support multitask, neck_num means use the no.neck_num neck output of model to eval

class easycv.core.evaluation.classification_eval.**MultiLabelEvaluator**(*dataset_name=None, metric_names=['mAP']*)

Bases: [easycv.core.evaluation.base_evaluator.Evaluator](#)

Multilabel Classification evaluator.

__init__(*dataset_name=None, metric_names=['mAP']*)

Parameters

- **dataset_name** – eval dataset name
- **metric_names** – eval metrics name

mAP(*pred*, *target*)

Calculate the mean average precision with respect of classes. :param *pred*: The model prediction with shape

(N, C), where C is the number of classes.

Parameters **target** (*torch.Tensor* / *np.ndarray*) – The target of each prediction with shape (N, C), where C is the number of classes. 1 stands for positive examples, 0 stands for negative examples and -1 stands for difficult examples.

Returns A single float as mAP value.

Return type float

average_precision(*pred*, *target*)

Calculate the average precision for a single class. AP summarizes a precision-recall curve as the weighted mean of maximum precisions obtained for any $r' > r$, where r is the recall: .. math:

$$\text{AP} = \sum_n (R_n - R_{n-1}) P_n$$

Note that no approximation is involved since the curve is piecewise constant. :param *pred*: The model prediction with shape (N,). :type *pred*: np.ndarray :param *target*: The target of each prediction with shape (N,). :type *target*: np.ndarray

Returns a single float as average precision value.

Return type float

easycv.core.evaluation.coco_evaluation module

Class for evaluating object detections with COCO metrics.

class easycv.core.evaluation.coco_evaluation.CocoDetectionEvaluator(*classes*, *include_metrics_per_category=False*, *all_metrics_per_category=False*, *coco_analyze=False*, *dataset_name=None*, *metric_names=['DetectionBoxes_Precision/mAP']*)

Bases: [easycv.core.evaluation.base_evaluator.Evaluator](#)

Class to evaluate COCO detection metrics.

__init__(*classes*, *include_metrics_per_category=False*, *all_metrics_per_category=False*, *coco_analyze=False*, *dataset_name=None*, *metric_names=['DetectionBoxes_Precision/mAP']*)

Constructor.

Parameters

- **classes** – a list of class name
- **include_metrics_per_category** – If True, include metrics for each category.
- **all_metrics_per_category** – Whether to include all the summary metrics for each category in *per_category_ap*. Be careful with setting it to true if you have more than handful of , because it will pollute your mldash.

- **coco_analyze** – If True, will analyze the detection result using coco analysis.
- **dataset_name** – If not None, dataset_name will be inserted to each metric name.

clear()

Clears the state to prepare for a fresh evaluation.

add_single_ground_truth_image_info(image_id, groundtruth_dict)

Adds groundtruth for a single image to be used for evaluation.

If the image has already been added, a warning is logged, and groundtruth is ignored.

Parameters

- **image_id** – A unique string/integer identifier for the image.
- **groundtruth_dict** – A dictionary containing
 - InputDataFields.groundtruth_boxes** float32 numpy array of shape [num_boxes, 4] containing *num_boxes* groundtruth boxes of the format [ymin, xmin, ymax, xmax] in absolute image coordinates.
 - InputDataFields.groundtruth_classes** integer numpy array of shape [num_boxes] containing 1-indexed groundtruth classes for the boxes.
 - InputDataFields.groundtruth_is_crowd** (optional): integer numpy array of shape [num_boxes] containing iscrowd flag for groundtruth boxes.

add_single_detected_image_info(image_id, detections_dict)

Adds detections for a single image to be used for evaluation.

If a detection has already been added for this image id, a warning is logged, and the detection is skipped.

Parameters

- **image_id** – A unique string/integer identifier for the image.
- **detections_dict** – A dictionary containing
 - DetectionResultFields.detection_boxes** float32 numpy array of shape [num_boxes, 4] containing *num_boxes* detection boxes of the format [ymin, xmin, ymax, xmax] in absolute image coordinates.
 - DetectionResultFields.detection_scores** float32 numpy array of shape [num_boxes] containing detection scores for the boxes.
 - DetectionResultFields.detection_classes** integer numpy array of shape [num_boxes] containing 1-indexed detection classes for the boxes.

Raises ValueError – If groundtruth for the image_id is not available.

```
class easycv.core.evaluation.coco_evaluation.CocoMaskEvaluator(classes, include_metrics_per_category=False,
                                                             dataset_name=None, metric_names=['DetectionMasks_Precision/mAP'])
```

Bases: [easycv.core.evaluation.base_evaluator.Evaluator](#)

Class to evaluate COCO detection metrics.

```
__init__(classes, include_metrics_per_category=False, dataset_name=None,
          metric_names=['DetectionMasks_Precision/mAP'])
```

Constructor.

Parameters

- **categories** – A list of dicts, each of which has the following keys :id: (required) an integer id uniquely identifying this category. :name: (required) string representing category name e.g., 'cat', 'dog'.
- **include_metrics_per_category** – If True, include metrics for each category.

clear()

Clears the state to prepare for a fresh evaluation.

add_single_ground_truth_image_info(*image_id*, *groundtruth_dict*)

Adds groundtruth for a single image to be used for evaluation.

If the image has already been added, a warning is logged, and groundtruth is ignored.

Parameters

- **image_id** – A unique string/integer identifier for the image.
- **groundtruth_dict** – A dictionary containing :InputDataFields.groundtruth_boxes: float32 numpy array of shape

[num_boxes, 4] containing *num_boxes* groundtruth boxes of the format [ymin, xmin, ymax, xmax] in absolute image coordinates.

InputDataFields.groundtruth_classes integer numpy array of shape [num_boxes] containing 1-indexed groundtruth classes for the boxes.

InputDataFields.groundtruth_instance_masks uint8 numpy array of shape [num_boxes, image_height, image_width] containing groundtruth masks corresponding to the boxes. The elements of the array must be in {0, 1}.

add_single_detected_image_info(*image_id*, *detections_dict*)

Adds detections for a single image to be used for evaluation.

If a detection has already been added for this image id, a warning is logged, and the detection is skipped.

Parameters

- **image_id** – A unique string/integer identifier for the image.
- **detections_dict** – A dictionary containing - DetectionResultFields.detection_scores: float32 numpy array of shape [num_boxes] containing detection scores for the boxes. DetectionResultFields.detection_classes: integer numpy array of shape [num_boxes] containing 1-indexed detection classes for the boxes. DetectionResultFields.detection_masks: optional uint8 numpy array of shape [num_boxes, image_height, image_width] containing instance masks corresponding to the boxes. The elements of the array must be in {0, 1}.

Raises ValueError – If groundtruth for the image_id is not available or if spatial shapes of groundtruth_instance_masks and detection_masks are incompatible.

```
class easycv.core.evaluation.coco_evaluation.CoCoPoseTopDownEvaluator(dataset_name=None,  
                                                                    metric_names=['AP'],  
                                                                    **kwargs)
```

Bases: [easycv.core.evaluation.base_evaluator.Evaluator](#)

Class to evaluate COCO keypoint topdown metrics.

```
__init__(dataset_name=None, metric_names=['AP'], **kwargs)
```

Construct eval ops from tensor

Parameters

- **dataset_name** (*str*) – dataset name to be evaluated
- **metric_names** (*List[str]*) – metric names this evaluator will return

```
class easycv.core.evaluation.coco_evaluation.CocoPanopticEvaluator(dataset_name=None,
                                                                metric_names=['PQ'],
                                                                classes=None,
                                                                file_client_args={'backend':
                                                                'disk'}, **kwargs)
```

Bases: [easycv.core.evaluation.base_evaluator.Evaluator](#)

Class to evaluate COCO panoptic metrics.

```
__init__(dataset_name=None, metric_names=['PQ'], classes=None, file_client_args={'backend': 'disk'},
        **kwargs)
```

Construct eval ops from tensor

Parameters

- **dataset_name** (*str*) – dataset name to be evaluated
- **metric_names** (*List[str]*) – metric names this evaluator will return

```
evaluate(gt_json, gt_folder, pred_json, pred_folder, categories, nproc=32, classwise=False, **kwargs)
```

```
parse_pq_results(pq_results)
```

Parse the Panoptic Quality results.

```
easycv.core.evaluation.coco_evaluation.pq_compute_single_core(proc_id, annotation_set, gt_folder,
                                                            pred_folder, categories,
                                                            file_client=None, print_log=False)
```

The single core function to evaluate the metric of Panoptic Segmentation.

Same as the function with the same name in *panopticapi*. Only the function to load the images is changed to use the file client.

Parameters

- **proc_id** (*int*) – The id of the mini process.
- **gt_folder** (*str*) – The path of the ground truth images.
- **pred_folder** (*str*) – The path of the prediction images.
- **categories** (*str*) – The categories of the dataset.
- **file_client** (*object*) – The file client of the dataset. If None, the backend will be set to *disk*.
- **print_log** (*bool*) – Whether to print the log. Defaults to False.

```
easycv.core.evaluation.coco_evaluation.pq_compute_multi_core(matched_annotations_list, gt_folder,
                                                            pred_folder, categories,
                                                            file_client=None, nproc=32)
```

Evaluate the metrics of Panoptic Segmentation with multithreading.

Same as the function with the same name in *panopticapi*.

Parameters

- **matched_annotations_list** (*list*) – The matched annotation list. Each element is a tuple of annotations of the same image with the format (*gt_anns, pred_anns*).
- **gt_folder** (*str*) – The path of the ground truth images.
- **pred_folder** (*str*) – The path of the prediction images.

- **categories** (*str*) – The categories of the dataset.
- **file_client** (*object*) – The file client of the dataset. If None, the backend will be set to *disk*.
- **nproc** (*int*) – Number of processes for panoptic quality computing. Defaults to 32. When *nproc* exceeds the number of cpu cores, the number of cpu cores is used.

easycv.core.evaluation.coco_tools module

Wrappers for third party pycocotools to be used within object_detection.

Note that nothing in this file is tensorflow related and thus cannot be called directly as a slim metric, for example.

TODO(jonathanhuang): wrap as a slim metric in metrics.py

Usage example: given a set of images with ids in the list *image_ids* and corresponding lists of numpy arrays encoding groundtruth (boxes and classes) and detections (boxes, scores and classes), where elements of each list correspond to detections/annotations of a single image, then evaluation (in multi-class mode) can be invoked as follows:

```
groundtruth_dict = coco_tools.ExportGroundtruthToCOCO( image_ids,    groundtruth_boxes_list,
                                                       groundtruth_classes_list, max_num_classes, output_path=None)

detections_list = coco_tools.ExportDetectionsToCOCO( image_ids,    detection_boxes_list,    detec-
                                                    tion_scores_list, detection_classes_list, output_path=None)

groundtruth      =      coco_tools.COCOWrapper(groundtruth_dict)      detections      =
groundtruth.LoadAnnotations(detections_list) evaluator = coco_tools.COCOEvalWrapper(groundtruth,
detections,

                                agnostic_mode=False)

metrics = evaluator.ComputeMetrics()
```

```
class easycv.core.evaluation.coco_tools.COCOWrapper(dataset, detection_type='bbox')
```

Bases: `xtcocotools.coco.COCO`

Wrapper for the pycocotools COCO class.

```
__init__(dataset, detection_type='bbox')
COCOWrapper constructor.
```

See <http://mscoco.org/dataset/#format> for a description of the format. By default, the `coco.COCO` class constructor reads from a JSON file. This function duplicates the same behavior but loads from a dictionary, allowing us to perform evaluation without writing to external storage.

Parameters

- **dataset** – a dictionary holding bounding box annotations in the COCO format.
- **detection_type** – type of detections being wrapped. Can be one of ['bbox', 'segmentation']

Raises ValueError – if *detection_type* is unsupported.

```
LoadAnnotations(annotations)
```

Load annotations dictionary into COCO datastructure.

See <http://mscoco.org/dataset/#format> for a description of the annotations format. As above, this function replicates the default behavior of the API but does not require writing to external storage.

Parameters annotations – python list holding object detection results where each detection is encoded as a dict with required keys ['image_id', 'category_id', 'score'] and one of ['bbox', 'segmentation'] based on *detection_type*.

Returns a coco.COCO datastructure holding object detection annotations results

Raises

- **ValueError** – if annotations is not a list
- **ValueError** – if annotations do not correspond to the images contained in self.

class `easycv.core.evaluation.coco_tools.COCOEvalWrapper`(*groundtruth=None, detections=None, agnostic_mode=False, iou_type='bbox'*)

Bases: `easycv.core.evaluation.custom_cocotools.cocoeval.COCOEval`

Wrapper for the pycocotools COCOeval class.

To evaluate, create two objects (groundtruth_dict and detections_list) using the conventions listed at <http://mscoco.org/dataset/#format>. Then call evaluation as follows:

```
groundtruth      =      coco_tools.COCOWrapper(groundtruth_dict)      detec-
tions            =      groundtruth.LoadAnnotations(detections_list)    evaluator      =
coco_tools.COCOEvalWrapper(groundtruth, detections,
                             agnostic_mode=False)

metrics = evaluator.ComputeMetrics()
```

__init__(*groundtruth=None, detections=None, agnostic_mode=False, iou_type='bbox'*)
COCOEvalWrapper constructor.

Note that for the area-based metrics to be meaningful, detection and groundtruth boxes must be in image coordinates measured in pixels.

Parameters

- **groundtruth** – a coco.COCO (or coco_tools.COCOWrapper) object holding groundtruth annotations
- **detections** – a coco.COCO (or coco_tools.COCOWrapper) object holding detections
- **agnostic_mode** – boolean (default: False). If True, evaluation ignores class labels, treating all detections as proposals.
- **iou_type** – IOU type to use for evaluation. Supports *bbox* or *segm*.

GetCategory(*category_id*)

Fetches dictionary holding category information given category id.

Parameters *category_id* – integer id

Returns dictionary holding 'id', 'name'.

GetAgnosticMode()

Returns true if COCO Eval is configured to evaluate in agnostic mode.

GetCategoryIdList()

Returns list of valid category ids.

ComputeMetrics(*include_metrics_per_category=False, all_metrics_per_category=False*)

Computes detection metrics.

Parameters

- **include_metrics_per_category** – If True, will include metrics per category.

- **all_metrics_per_category** – If true, include all the summary metrics for each category in per_category_ap. Be careful with setting it to true if you have more than handful of categories, because it will pollute your mldash.

Returns

a dictionary holding:

'Precision/mAP': mean average precision over classes averaged over IOU
thresholds ranging from .5 to .95 with .05 increments

'Precision/mAP@.50IOU': mean average precision at 50% IOU **'Precision/mAP@.75IOU':** mean average precision at 75% IOU **'Precision/mAP (small)':** mean average precision for small objects

(area < 32² pixels)

'Precision/mAP (medium)': mean average precision for medium sized objects
(32² pixels < area < 96² pixels)

'Precision/mAP (large)': mean average precision for large objects (96² pixels < area < 10000² pixels)

'Recall/AR@1': average recall with 1 detection **'Recall/AR@10':** average recall with 10 detections **'Recall/AR@100':** average recall with 100 detections **'Recall/AR@100 (small)':** average recall for small objects with 100

detections

'Recall/AR@100 (medium)': average recall for medium objects with 100
detections

'Recall/AR@100 (large)': average recall for large objects with 100 detections

2. per_category_ap: a dictionary holding category specific results with

keys of the form: 'Precision mAP ByCategory/category' (without the supercategory part if no supercategories exist). For backward compatibility 'Performance-ByCategory' is included in the output regardless of all_metrics_per_category. If evaluating class-agnostic mode, per_category_ap is an empty dictionary.

Return type

1. summary_metrics

Raises ValueError – If category_stats does not exist.

Analyze()

Analyze detection results.

Args:

Returns

A dictionary containing images of analyzing result images, key is the image name, value is a [H,W,3] numpy array which represent the image content. You can refer to <http://cocodataset.org/#detection-eval> section 4 Analysis code.

```

easycv.core.evaluation.coco_tools.ExportSingleImageGroundtruthToCoco(image_id,
                                                                    next_annotation_id,
                                                                    category_id_set,
                                                                    groundtruth_boxes,
                                                                    groundtruth_classes,
                                                                    groundtruth_masks=None,
                                                                    groundtruth_is_crowd=None,
                                                                    super_categories=None)

```

Export groundtruth of a single image to COCO format.

This function converts groundtruth detection annotations represented as numpy arrays to dictionaries that can be ingested by the COCO evaluation API. Note that the image_ids provided here must match the ones given to `ExportSingleImageDetectionsToCoco`. We assume that boxes and classes are in correspondence - that is: `groundtruth_boxes[i, :]`, and `groundtruth_classes[i]` are associated with the same groundtruth annotation.

In the exported result, “area” fields are always set to the area of the groundtruth bounding box.

Parameters

- **image_id** – a unique image identifier either of type integer or string.
- **next_annotation_id** – integer specifying the first id to use for the groundtruth annotations. All annotations are assigned a continuous integer id starting from this value.
- **category_id_set** – A set of valid class ids. Groundtruth with classes not in `category_id_set` are dropped.
- **groundtruth_boxes** – numpy array (float32) with shape `[num_gt_boxes, 4]`
- **groundtruth_classes** – numpy array (int) with shape `[num_gt_boxes]`
- **groundtruth_masks** – optional uint8 numpy array of shape `[num_detections, image_height, image_width]` containing detection_masks.
- **groundtruth_is_crowd** – optional numpy array (int) with shape `[num_gt_boxes]` indicating whether groundtruth boxes are crowd.
- **super_categories** – optional list of str indicating each box super category

Returns a list of groundtruth annotations for a single image in the COCO format.

Raises ValueError – if (1) `groundtruth_boxes` and `groundtruth_classes` do not have the right lengths or (2) if each of the elements inside these lists do not have the correct shapes or (3) if `image_ids` are not integers

```

easycv.core.evaluation.coco_tools.ExportGroundtruthToCOCO(image_ids, groundtruth_boxes,
                                                            groundtruth_classes, categories,
                                                            output_path=None)

```

Export groundtruth detection annotations in numpy arrays to COCO API.

This function converts a set of groundtruth detection annotations represented as numpy arrays to dictionaries that can be ingested by the COCO API. Inputs to this function are three lists: image ids for each groundtruth image, groundtruth boxes for each image and groundtruth classes respectively. Note that the image_ids provided here must match the ones given to the `ExportDetectionsToCOCO` function in order for evaluation to work properly. We assume that for each image, boxes, scores and classes are in correspondence — that is: `image_id[i]`, `groundtruth_boxes[i, :]` and `groundtruth_classes[i]` are associated with the same groundtruth annotation.

In the exported result, “area” fields are always set to the area of the groundtruth bounding box and “iscrowd” fields are always set to 0. TODO(jonathanhuang): pass in “iscrowd” array for evaluating on COCO dataset.

Parameters

- **image_ids** – a list of unique image identifier either of type integer or string.

- **groundtruth_boxes** – list of numpy arrays with shape [num_gt_boxes, 4] (note that num_gt_boxes can be different for each entry in the list)
- **groundtruth_classes** – list of numpy arrays (int) with shape [num_gt_boxes] (note that num_gt_boxes can be different for each entry in the list)
- **categories** – a list of dictionaries representing all possible categories. Each dict in this list has the following keys:
 - 'id': (required) an integer id uniquely identifying this category
 - 'name': (required) string representing category name
 - e.g., 'cat', 'dog', 'pizza'
 - 'supercategory': (optional) string representing the supercategory e.g., 'animal', 'vehicle', 'food', etc
- **output_path** – (optional) path for exporting result to JSON

Returns dictionary that can be read by COCO API

Raises ValueError – if (1) groundtruth_boxes and groundtruth_classes do not have the right lengths or (2) if each of the elements inside these lists do not have the correct shapes or (3) if image_ids are not integers

```
easycv.core.evaluation.coco_tools.ExportSingleImageDetectionBoxesToCoco(image_id,  
                                                                           category_id_set,  
                                                                           detection_boxes,  
                                                                           detection_scores,  
                                                                           detection_classes)
```

Export detections of a single image to COCO format.

This function converts detections represented as numpy arrays to dictionaries that can be ingested by the COCO evaluation API. Note that the image_ids provided here must match the ones given to the ExportSingleImageDetectionBoxesToCoco. We assume that boxes, and classes are in correspondence - that is: boxes[i, :], and classes[i] are associated with the same groundtruth annotation.

Parameters

- **image_id** – unique image identifier either of type integer or string.
- **category_id_set** – A set of valid class ids. Detections with classes not in category_id_set are dropped.
- **detection_boxes** – float numpy array of shape [num_detections, 4] containing detection boxes.
- **detection_scores** – float numpy array of shape [num_detections] containing scored for the detection boxes.
- **detection_classes** – integer numpy array of shape [num_detections] containing the classes for detection boxes.

Returns a list of detection annotations for a single image in the COCO format.

Raises ValueError – if (1) detection_boxes, detection_scores and detection_classes do not have the right lengths or (2) if each of the elements inside these lists do not have the correct shapes or (3) if image_ids are not integers.

```
easycv.core.evaluation.coco_tools.ExportSingleImageDetectionMasksToCoco(image_id,
                                                                           category_id_set,
                                                                           detection_masks,
                                                                           detection_scores,
                                                                           detection_classes)
```

Export detection masks of a single image to COCO format.

This function converts detections represented as numpy arrays to dictionaries that can be ingested by the COCO evaluation API. We assume that `detection_masks`, `detection_scores`, and `detection_classes` are in correspondence - that is: `detection_masks[i, :]`, `detection_classes[i]` and `detection_scores[i]`

are associated with the same annotation.

Parameters

- **image_id** – unique image identifier either of type integer or string.
- **category_id_set** – A set of valid class ids. Detections with classes not in `category_id_set` are dropped.
- **detection_masks** – uint8 numpy array of shape `[num_detections, image_height, image_width]` containing detection_masks.
- **detection_scores** – float numpy array of shape `[num_detections]` containing scores for detection masks.
- **detection_classes** – integer numpy array of shape `[num_detections]` containing the classes for detection masks.

Returns a list of detection mask annotations for a single image in the COCO format.

Raises ValueError – if (1) `detection_masks`, `detection_scores` and `detection_classes` do not have the right lengths or (2) if each of the elements inside these lists do not have the correct shapes or (3) if `image_ids` are not integers.

```
easycv.core.evaluation.coco_tools.ExportDetectionsToCOCO(image_ids, detection_boxes,
                                                         detection_scores, detection_classes,
                                                         categories, output_path=None)
```

Export detection annotations in numpy arrays to COCO API.

This function converts a set of predicted detections represented as numpy arrays to dictionaries that can be ingested by the COCO API. Inputs to this function are lists, consisting of boxes, scores and classes, respectively, corresponding to each image for which detections have been produced. Note that the `image_ids` provided here must match the ones given to the `ExportGroundtruthToCOCO` function in order for evaluation to work properly.

We assume that for each image, boxes, scores and classes are in correspondence — that is: `detection_boxes[i, :]`, `detection_scores[i]` and `detection_classes[i]` are associated with the same detection.

Parameters

- **image_ids** – a list of unique image identifier either of type integer or string.
- **detection_boxes** – list of numpy arrays with shape `[num_detection_boxes, 4]`
- **detection_scores** – list of numpy arrays (float) with shape `[num_detection_boxes]`. Note that `num_detection_boxes` can be different for each entry in the list.
- **detection_classes** – list of numpy arrays (int) with shape `[num_detection_boxes]`. Note that `num_detection_boxes` can be different for each entry in the list.
- **categories** – a list of dictionaries representing all possible categories. Each dict in this list must have an integer 'id' key uniquely identifying this category.

- **output_path** – (optional) path for exporting result to JSON

Returns list of dictionaries that can be read by COCO API, where each entry corresponds to a single detection and has keys from: ['image_id', 'category_id', 'bbox', 'score'].

Raises ValueError – if (1) detection_boxes and detection_classes do not have the right lengths or (2) if each of the elements inside these lists do not have the correct shapes or (3) if image_ids are not integers.

```
easycv.core.evaluation.coco_tools.ExportSegmentsToCOCO(image_ids, detection_masks,  
                                                         detection_scores, detection_classes,  
                                                         categories, output_path=None)
```

Export segmentation masks in numpy arrays to COCO API.

This function converts a set of predicted instance masks represented as numpy arrays to dictionaries that can be ingested by the COCO API. Inputs to this function are lists, consisting of segments, scores and classes, respectively, corresponding to each image for which detections have been produced.

Note this function is recommended to use for small dataset. For large dataset, it should be used with a merge function (e.g. in map reduce), otherwise the memory consumption is large.

We assume that for each image, masks, scores and classes are in correspondence — that is: detection_masks[i, :, :], detection_scores[i] and detection_classes[i] are associated with the same detection.

Parameters

- **image_ids** – list of image ids (typically ints or strings)
- **detection_masks** – list of numpy arrays with shape [num_detection, h, w, 1] and type uint8. The height and width should match the shape of corresponding image.
- **detection_scores** – list of numpy arrays (float) with shape [num_detection]. Note that num_detection can be different for each entry in the list.
- **detection_classes** – list of numpy arrays (int) with shape [num_detection]. Note that num_detection can be different for each entry in the list.
- **categories** – a list of dictionaries representing all possible categories. Each dict in this list must have an integer 'id' key uniquely identifying this category.
- **output_path** – (optional) path for exporting result to JSON

Returns list of dictionaries that can be read by COCO API, where each entry corresponds to a single detection and has keys from: ['image_id', 'category_id', 'segmentation', 'score'].

Raises ValueError – if detection_masks and detection_classes do not have the right lengths or if each of the elements inside these lists do not have the correct shapes.

```
easycv.core.evaluation.coco_tools.ExportKeypointsToCOCO(image_ids, detection_keypoints,  
                                                         detection_scores, detection_classes,  
                                                         categories, output_path=None)
```

Exports keypoints in numpy arrays to COCO API.

This function converts a set of predicted keypoints represented as numpy arrays to dictionaries that can be ingested by the COCO API. Inputs to this function are lists, consisting of keypoints, scores and classes, respectively, corresponding to each image for which detections have been produced.

We assume that for each image, keypoints, scores and classes are in correspondence — that is: detection_keypoints[i, :, :], detection_scores[i] and detection_classes[i] are associated with the same detection.

Parameters

- **image_ids** – list of image ids (typically ints or strings)

- **detection_keypoints** – list of numpy arrays with shape [num_detection, num_keypoints, 2] and type float32 in absolute x-y coordinates.
- **detection_scores** – list of numpy arrays (float) with shape [num_detection]. Note that num_detection can be different for each entry in the list.
- **detection_classes** – list of numpy arrays (int) with shape [num_detection]. Note that num_detection can be different for each entry in the list.
- **categories** – a list of dictionaries representing all possible categories. Each dict in this list must have an integer 'id' key uniquely identifying this category and an integer 'num_keypoints' key specifying the number of keypoints the category has.
- **output_path** – (optional) path for exporting result to JSON

Returns list of dictionaries that can be read by COCO API, where each entry corresponds to a single detection and has keys from: ['image_id', 'category_id', 'keypoints', 'score'].

Raises ValueError – if detection_keypoints and detection_classes do not have the right lengths or if each of the elements inside these lists do not have the correct shapes.

easycv.core.evaluation.faceid_pair_eval module

__init__(dataset_name=None, metric_names=['acc'], kfold=10, pca=0)

Faceid small dataset evaluator, do pair match validation :param dataset_name: faceid small validate set name, include [lfw, agedb_30, cfp_ff, cfp_fw, calfw] :param kfold: Kfold for train/val split :param pca: pca dimensions, if > 0, do PCA for input feature, transfer to [n, pca]

Returns None

easycv.core.evaluation.metric_registry module**class** easycv.core.evaluation.metric_registry.**MetricRegistry**

Bases: object

__init__()

Initialize self. See help(type(self)) for accurate signature.

get(evaluator_type)**register_default_best_metric**(cls, metric_name, metric_cmp_op='max')

Register default best metric for each evaluator

Parameters

- **cls** (object) – class object
- **metric_name** (str or List[str]) – default best metric name
- **metric_cmp_op** (str or List[str]) – metric compare operation, should be one of ["max", "min"]

easycv.core.evaluation.mse_eval module**class** easycv.core.evaluation.mse_eval.**MSEEvaluator**(dataset_name=None, metric_names=['avg_mse'], neck_num=None)Bases: [easycv.core.evaluation.base_evaluator.Evaluator](#)

MSEEvaluator evaluator,

__init__(dataset_name=None, metric_names=['avg_mse'], neck_num=None)**easycv.core.evaluation.retrival_topk_eval module****class** easycv.core.evaluation.retrival_topk_eval.**RetrivalTopKEvaluator**(topk=(1, 2, 4, 8), norm=0, metric='cos', pca=0, dataset_name=None, metric_names=['R@K=1'], save_results=False, save_results_dir="", feature_keyword=['neck'])Bases: [easycv.core.evaluation.base_evaluator.Evaluator](#)

RetrivalTopK evaluator, Retrival evaluate do the topK retrival, by measuring the distance of every 1 vs other. get the topK nearest, and count the match of ID. if Retrival = 1, Miss = 0. Finally average all RetrivalRate.

__init__(topk=(1, 2, 4, 8), norm=0, metric='cos', pca=0, dataset_name=None, metric_names=['R@K=1'], save_results=False, save_results_dir="", feature_keyword=['neck'])**Parameters** **top_k** – tuple of int, evaluate top_k acc

easycv.core.evaluation.top_down_eval module

`easycv.core.evaluation.top_down_eval.pose_pck_accuracy(output, target, mask, thr=0.05, normalize=None)`

Calculate the pose accuracy of PCK for each individual keypoint and the averaged accuracy across all keypoints from heatmaps.

Note: PCK metric measures accuracy of the localization of the body joints. The distances between predicted positions and the ground-truth ones are typically normalized by the bounding box size. The threshold (thr) of the normalized distance is commonly set as 0.05, 0.1 or 0.2 etc.

batch_size: N num_keypoints: K heatmap height: H heatmap width: W

Parameters

- **output** (`np.ndarray[N, K, H, W]`) – Model output heatmaps.
- **target** (`np.ndarray[N, K, H, W]`) – Groundtruth heatmaps.
- **mask** (`np.ndarray[N, K]`) – Visibility of the target. False for invisible joints, and True for visible. Invisible joints will be ignored for accuracy calculation.
- **thr** (`float`) – Threshold of PCK calculation. Default 0.05.
- **normalize** (`np.ndarray[N, 2]`) – Normalization factor for H&W.

Returns

A tuple containing keypoint accuracy.

- `np.ndarray[K]`: Accuracy of each keypoint.
- `float`: Averaged accuracy across all keypoints.
- `int`: Number of valid keypoints.

Return type tuple

`easycv.core.evaluation.top_down_eval.keypoint_pck_accuracy(pred, gt, mask, thr, normalize)`

Calculate the pose accuracy of PCK for each individual keypoint and the averaged accuracy across all keypoints for coordinates.

Note: PCK metric measures accuracy of the localization of the body joints. The distances between predicted positions and the ground-truth ones are typically normalized by the bounding box size. The threshold (thr) of the normalized distance is commonly set as 0.05, 0.1 or 0.2 etc.

batch_size: N num_keypoints: K

Parameters

- **pred** (`np.ndarray[N, K, 2]`) – Predicted keypoint location.
- **gt** (`np.ndarray[N, K, 2]`) – Groundtruth keypoint location.
- **mask** (`np.ndarray[N, K]`) – Visibility of the target. False for invisible joints, and True for visible. Invisible joints will be ignored for accuracy calculation.
- **thr** (`float`) – Threshold of PCK calculation.
- **normalize** (`np.ndarray[N, 2]`) – Normalization factor for H&W.

Returns

A tuple containing keypoint accuracy.

- **acc** (`np.ndarray[K]`): Accuracy of each keypoint.
- **avg_acc** (`float`): Averaged accuracy across all keypoints.
- **cnt** (`int`): Number of valid keypoints.

Return type tuple

`easycv.core.evaluation.top_down_eval.keypoint_auc(pred, gt, mask, normalize, num_step=20)`

Calculate the pose accuracy of PCK for each individual keypoint and the averaged accuracy across all keypoints for coordinates.

Note:

- **batch_size**: N
 - **num_keypoints**: K
-

Parameters

- **pred** (`np.ndarray[N, K, 2]`) – Predicted keypoint location.
- **gt** (`np.ndarray[N, K, 2]`) – Groundtruth keypoint location.
- **mask** (`np.ndarray[N, K]`) – Visibility of the target. False for invisible joints, and True for visible. Invisible joints will be ignored for accuracy calculation.
- **normalize** (`float`) – Normalization factor.

Returns Area under curve.

Return type float

`easycv.core.evaluation.top_down_eval.keypoint_nme(pred, gt, mask, normalize_factor)`

Calculate the normalized mean error (NME).

Note:

- **batch_size**: N
 - **num_keypoints**: K
-

Parameters

- **pred** (`np.ndarray[N, K, 2]`) – Predicted keypoint location.
- **gt** (`np.ndarray[N, K, 2]`) – Groundtruth keypoint location.
- **mask** (`np.ndarray[N, K]`) – Visibility of the target. False for invisible joints, and True for visible. Invisible joints will be ignored for accuracy calculation.
- **normalize_factor** (`np.ndarray[N, 2]`) – Normalization factor.

Returns normalized mean error

Return type float

`easycv.core.evaluation.top_down_eval.keypoint_epe(pred, gt, mask)`
Calculate the end-point error.

Note:

- `batch_size`: N
 - `num_keypoints`: K
-

Parameters

- **pred** (`np.ndarray[N, K, 2]`) – Predicted keypoint location.
- **gt** (`np.ndarray[N, K, 2]`) – Groundtruth keypoint location.
- **mask** (`np.ndarray[N, K]`) – Visibility of the target. False for invisible joints, and True for visible. Invisible joints will be ignored for accuracy calculation.

Returns Average end-point error.

Return type float

`easycv.core.evaluation.top_down_eval.post_dark_udp(coords, batch_heatmaps, kernel=3)`
DARK post-processing. Implemented by udp. Paper ref: Huang et al. The Devil is in the Details: Delving into Unbiased Data Processing for Human Pose Estimation (CVPR 2020). Zhang et al. Distribution-Aware Coordinate Representation for Human Pose Estimation (CVPR 2020).

Note: batch size: B num keypoints: K num persons: N height of heatmaps: H width of heatmaps: W B=1 for bottom_up paradigm where all persons share the same heatmap. B=N for top_down paradigm where each person has its own heatmaps.

Parameters

- **coords** (`np.ndarray[N, K, 2]`) – Initial coordinates of human pose.
- **batch_heatmaps** (`np.ndarray[B, K, H, W]`) – batch_heatmaps
- **kernel** (`int`) – Gaussian kernel size (K) for modulation.

Returns Refined coordinates.

Return type res (`np.ndarray[N, K, 2]`)

`easycv.core.evaluation.top_down_eval.keypoints_from_heatmaps(heatmaps, center, scale, unbiased=False, post_process='default', kernel=11, valid_radius_factor=0.0546875, use_udp=False, target_type='GaussianHeatmap')`

Get final keypoint predictions from heatmaps and transform them back to the image.

Note: batch size: N num keypoints: K heatmap height: H heatmap width: W

Parameters

- **heatmaps** (*np.ndarray[N, K, H, W], dtype=float32*) – model predicted heatmaps.
- **center** (*np.ndarray[N, 2]*) – Center of the bounding box (x, y).
- **scale** (*np.ndarray[N, 2]*) – Scale of the bounding box wrt height/width.
- **post_process** (*str/None*) – Choice of methods to post-process heatmaps. Currently supported: None, 'default', 'unbiased', 'megvii'.
- **unbiased** (*bool*) – Option to use unbiased decoding. Mutually exclusive with megvii. Note: this arg is deprecated and unbiased=True can be replaced by post_process='unbiased' Paper ref: Zhang et al. Distribution-Aware Coordinate Representation for Human Pose Estimation (CVPR 2020).
- **kernel** (*int*) – Gaussian kernel size (K) for modulation, which should match the heatmap gaussian sigma when training. K=17 for sigma=3 and k=11 for sigma=2.
- **valid_radius_factor** (*float*) – The radius factor of the positive area in classification heatmap for UDP.
- **use_udp** (*bool*) – Use unbiased data processing.
- **target_type** (*str*) – 'GaussianHeatmap' or 'CombinedTarget'. GaussianHeatmap: Classification target with gaussian distribution. CombinedTarget: The combination of classification target (response map) and regression target (offset map). Paper ref: Huang et al. The Devil is in the Details: Delving into Unbiased Data Processing for Human Pose Estimation (CVPR 2020).

Returns

A tuple containing keypoint predictions and scores.

- preds (*np.ndarray[N, K, 2]*): Predicted keypoint location in images.
- maxvals (*np.ndarray[N, K, 1]*): Scores (confidence) of the keypoints.

Return type tuple

25.1.2 easycv.core.optimizer package

Submodules

easycv.core.optimizer.lars module

```
class easycv.core.optimizer.lars.LARS(params, lr=<required parameter>, momentum=0, dampening=0,
                                     weight_decay=0, eta=0.001, nesterov=False)
```

Bases: torch.optim.optimizer.Optimizer

Implements layer-wise adaptive rate scaling for SGD.

Parameters

- **params** (*iterable*) – iterable of parameters to optimize or dicts defining parameter groups
- **lr** (*float*) – base learning rate (gamma_0)
- **momentum** (*float, optional*) – momentum factor (default: 0) ("m")
- **weight_decay** (*float, optional*) – weight decay (L2 penalty) (default: 0) ("beta")
- **dampening** (*float, optional*) – dampening for momentum (default: 0)

- **eta** (*float, optional*) – LARS coefficient
- **nesterov** (*bool, optional*) – enables Nesterov momentum (default: False)

Based on Algorithm 1 of the following paper by You, Gitman, and Ginsburg. Large Batch Training of Convolutional Networks:

<https://arxiv.org/abs/1708.03888>

Example

```
>>> optimizer = LARS(model.parameters(), lr=0.1, momentum=0.9,
>>>                    weight_decay=1e-4, eta=1e-3)
>>> optimizer.zero_grad()
>>> loss_fn(model(input), target).backward()
>>> optimizer.step()
```

__init__ (*params, lr=<required parameter>, momentum=0, dampening=0, weight_decay=0, eta=0.001, nesterov=False*)

Initialize self. See help(type(self)) for accurate signature.

step (*closure=None*)

Performs a single optimization step.

Parameters closure (*callable, optional*) – A closure that reevaluates the model and returns the loss.

easycv.core.optimizer.ranger module

easycv.core.optimizer.ranger.centralized_gradient (*x, use_gc=True, gc_conv_only=False*)
credit - <https://github.com/Yonghongwei/Gradient-Centralization>

class easycv.core.optimizer.ranger.Ranger (*params, lr=0.001, alpha=0.5, k=6, N_sma_threshold=5, betas=(0.95, 0.999), eps=1e-05, weight_decay=0, use_gc=True, gc_conv_only=False, gc_loc=True*)

Bases: `torch.optim.optimizer.Optimizer`

Adam+LookAhead: refer to <https://github.com/lessw2020/Ranger-Deep-Learning-Optimizer>

__init__ (*params, lr=0.001, alpha=0.5, k=6, N_sma_threshold=5, betas=(0.95, 0.999), eps=1e-05, weight_decay=0, use_gc=True, gc_conv_only=False, gc_loc=True*)

Initialize self. See help(type(self)) for accurate signature.

step (*closure=None*)

Performs a single optimization step (parameter update).

Parameters closure (*Callable*) – A closure that reevaluates the model and returns the loss.
Optional for most optimizers.

Note: Unless otherwise specified, this function should not modify the `.grad` field of the parameters.

25.1.3 easycv.core.post_processing package

`easycv.core.post_processing.affine_transform(pt, trans_mat)`

Apply an affine transformation to the points.

Parameters

- **pt** (*np.ndarray*) – a 2 dimensional point to be transformed
- **trans_mat** (*np.ndarray*) – 2x3 matrix of an affine transform

Returns Transformed points.

Return type *np.ndarray*

`easycv.core.post_processing.flip_back(output_flipped, flip_pairs, target_type='GaussianHeatmap')`

Flip the flipped heatmaps back to the original form.

Note: batch_size: N num_keypoints: K heatmap height: H heatmap width: W

Parameters

- **output_flipped** (*np.ndarray[N, K, H, W]*) – The output heatmaps obtained from the flipped images.
- **flip_pairs** (*list[tuple()]*) – Pairs of keypoints which are mirrored (for example, left ear – right ear).
- **target_type** (*str*) – GaussianHeatmap or CombinedTarget

Returns heatmaps that flipped back to the original image

Return type *np.ndarray*

`easycv.core.post_processing.fliplr_joints(joints_3d, joints_3d_visible, img_width, flip_pairs)`

Flip human joints horizontally.

Note: num_keypoints: K

Parameters

- **joints_3d** (*np.ndarray([K, 3])*) – Coordinates of keypoints.
- **joints_3d_visible** (*np.ndarray([K, 1])*) – Visibility of keypoints.
- **img_width** (*int*) – Image width.
- **flip_pairs** (*list[tuple()]*) – Pairs of keypoints which are mirrored (for example, left ear – right ear).

Returns

Flipped human joints.

- **joints_3d_flipped** (*np.ndarray([K, 3])*): Flipped joints.
- **joints_3d_visible_flipped** (*np.ndarray([K, 1])*): Joint visibility.

Return type *tuple*

```
easycv.core.post_processing.fliplr_regression(regression, flip_pairs, center_mode='static',  
                                             center_x=0.5, center_index=0)
```

Flip human joints horizontally.

Note: batch_size: N num_keypoint: K

Parameters

- **regression** (*np.ndarray* [..., K, C]) – Coordinates of keypoints, where K is the joint number and C is the dimension. Example shapes are: - [N, K, C]: a batch of keypoints where N is the batch size. - [N, T, K, C]: a batch of pose sequences, where T is the frame number.
- **flip_pairs** (*list[tuple()]*) – Pairs of keypoints which are mirrored (for example, left ear – right ear).
- **center_mode** (*str*) – The mode to set the center location on the x-axis to flip around. Options are: - static: use a static x value (see center_x also) - root: use a root joint (see center_index also)
- **center_x** (*float*) – Set the x-axis location of the flip center. Only used when center_mode=static.
- **center_index** (*int*) – Set the index of the root joint, whose x location will be used as the flip center. Only used when center_mode=root.

Returns

Flipped human joints.

- regression_flipped (*np.ndarray* [..., K, C]): Flipped joints.

Return type tuple

```
easycv.core.post_processing.get_affine_transform(center, scale, rot, output_size, shift=(0.0, 0.0),  
                                              inv=False)
```

Get the affine transform matrix, given the center/scale/rot/output_size.

Parameters

- **center** (*np.ndarray*[2,]) – Center of the bounding box (x, y).
- **scale** (*np.ndarray*[2,]) – Scale of the bounding box wrt [width, height].
- **rot** (*float*) – Rotation angle (degree).
- **output_size** (*np.ndarray*[2,] | *list*(2,)) – Size of the destination heatmaps.
- **shift** (0-100%) – Shift translation ratio wrt the width/height. Default (0., 0.).
- **inv** (*bool*) – Option to inverse the affine transform direction. (inv=False: src->dst or inv=True: dst->src)

Returns The transform matrix.

Return type *np.ndarray*

```
easycv.core.post_processing.get_warp_matrix(theta, size_input, size_dst, size_target)
```

Calculate the transformation matrix under the constraint of unbiased. Paper ref: Huang et al. The Devil is in the Details: Delving into Unbiased Data Processing for Human Pose Estimation (CVPR 2020).

Parameters

- **theta** (*float*) – Rotation angle in degrees.
- **size_input** (*np.ndarray*) – Size of input image [w, h].
- **size_dst** (*np.ndarray*) – Size of output image [w, h].
- **size_target** (*np.ndarray*) – Size of ROI in input plane [w, h].

Returns A matrix for transformation.

Return type matrix (*np.ndarray*)

`easycv.core.post_processing.rotate_point(pt, angle_rad)`

Rotate a point by an angle.

Parameters

- **pt** (*list[float]*) – 2 dimensional point to be rotated
- **angle_rad** (*float*) – rotation angle by radian

Returns Rotated point.

Return type list[float]

`easycv.core.post_processing.transform_preds(coords, center, scale, output_size, use_udp=False)`

Get final keypoint predictions from heatmaps and apply scaling and translation to map them back to the image.

Note: num_keypoints: K

Parameters

- **coords** (*np.ndarray[K, ndims]*) –
 - If ndims=2, coords are predicted keypoint location.
 - If ndims=4, coords are composed of (x, y, scores, tags)
 - If ndims=5, coords are composed of (x, y, scores, tags, flipped_tags)
- **center** (*np.ndarray[2,]*) – Center of the bounding box (x, y).
- **scale** (*np.ndarray[2,]*) – Scale of the bounding box wrt [width, height].
- **output_size** (*np.ndarray[2,] | list(2,)*) – Size of the destination heatmaps.
- **use_udp** (*bool*) – Use unbiased data processing

Returns Predicted coordinates in the images.

Return type np.ndarray

`easycv.core.post_processing.warp_affine_joints(joints, mat)`

Apply affine transformation defined by the transform matrix on the joints.

Parameters

- **joints** (*np.ndarray[... , 2]*) – Origin coordinate of joints.
- **mat** (*np.ndarray[3, 2]*) – The affine matrix.

Returns Result coordinate of joints.

Return type matrix (*np.ndarray[... , 2]*)

`easycv.core.post_processing.oks_nms(kpts_db, thr, sigmas=None, vis_thr=None)`
OKS NMS implementations.

Parameters

- **kpts_db** – keypoints.
- **thr** – Retain overlap < thr.
- **sigmas** – standard deviation of keypoint labelling.
- **vis_thr** – threshold of the keypoint visibility.

Returns indexes to keep.

Return type np.ndarray

`easycv.core.post_processing.soft_oks_nms(kpts_db, thr, max_dets=20, sigmas=None, vis_thr=None)`
Soft OKS NMS implementations.

Parameters

- **kpts_db** –
- **thr** – retain oks overlap < thr.
- **max_dets** – max number of detections to keep.
- **sigmas** – Keypoint labelling uncertainty.

Returns indexes to keep.

Return type np.ndarray

Submodules

easycv.core.post_processing.nms module

`easycv.core.post_processing.nms.oks_iou(g, d, a_g, a_d, sigmas=None, vis_thr=None)`
Calculate oks ious.

Parameters

- **g** – Ground truth keypoints.
- **d** – Detected keypoints.
- **a_g** – Area of the ground truth object.
- **a_d** – Area of the detected object.
- **sigmas** – standard deviation of keypoint labelling.
- **vis_thr** – threshold of the keypoint visibility.

Returns The oks ious.

Return type list

`easycv.core.post_processing.nms.oks_nms(kpts_db, thr, sigmas=None, vis_thr=None)`
OKS NMS implementations.

Parameters

- **kpts_db** – keypoints.
- **thr** – Retain overlap < thr.

- **sigmas** – standard deviation of keypoint labelling.
- **vis_thr** – threshold of the keypoint visibility.

Returns indexes to keep.

Return type np.ndarray

`easycv.core.post_processing.nms.soft_oks_nms(kpts_db, thr, max_dets=20, sigmas=None, vis_thr=None)`
Soft OKS NMS implementations.

Parameters

- **kpts_db** –
- **thr** – retain oks overlap < thr.
- **max_dets** – max number of detections to keep.
- **sigmas** – Keypoint labelling uncertainty.

Returns indexes to keep.

Return type np.ndarray

easycv.core.post_processing.pose_transforms module

`easycv.core.post_processing.pose_transforms.fliplr_joints(joints_3d, joints_3d_visible, img_width, flip_pairs)`

Flip human joints horizontally.

Note: num_keypoints: K

Parameters

- **joints_3d** (`np.ndarray([K, 3])`) – Coordinates of keypoints.
- **joints_3d_visible** (`np.ndarray([K, 1])`) – Visibility of keypoints.
- **img_width** (`int`) – Image width.
- **flip_pairs** (`list[tuple()]`) – Pairs of keypoints which are mirrored (for example, left ear – right ear).

Returns

Flipped human joints.

- **joints_3d_flipped** (`np.ndarray([K, 3])`): Flipped joints.
- **joints_3d_visible_flipped** (`np.ndarray([K, 1])`): Joint visibility.

Return type tuple

`easycv.core.post_processing.pose_transforms.fliplr_regression(regression, flip_pairs, center_mode='static', center_x=0.5, center_index=0)`

Flip human joints horizontally.

Note: batch_size: N num_keypoint: K

Parameters

- **regression** (*np.ndarray* [..., K, C]) – Coordinates of keypoints, where K is the joint number and C is the dimension. Example shapes are: - [N, K, C]: a batch of keypoints where N is the batch size. - [N, T, K, C]: a batch of pose sequences, where T is the frame number.
- **flip_pairs** (*list[tuple()]*) – Pairs of keypoints which are mirrored (for example, left ear – right ear).
- **center_mode** (*str*) – The mode to set the center location on the x-axis to flip around. Options are: - static: use a static x value (see center_x also) - root: use a root joint (see center_index also)
- **center_x** (*float*) – Set the x-axis location of the flip center. Only used when center_mode=static.
- **center_index** (*int*) – Set the index of the root joint, whose x location will be used as the flip center. Only used when center_mode=root.

Returns

Flipped human joints.

- regression_flipped (*np.ndarray* [..., K, C]): Flipped joints.

Return type tuple

```
easycv.core.post_processing.pose_transforms.flip_back(output_flipped, flip_pairs,
                                                    target_type='GaussianHeatmap')
```

Flip the flipped heatmaps back to the original form.

Note: batch_size: N num_keypoints: K heatmap height: H heatmap width: W

Parameters

- **output_flipped** (*np.ndarray* [N, K, H, W]) – The output heatmaps obtained from the flipped images.
- **flip_pairs** (*list[tuple()]*) – Pairs of keypoints which are mirrored (for example, left ear – right ear).
- **target_type** (*str*) – GaussianHeatmap or CombinedTarget

Returns heatmaps that flipped back to the original image

Return type np.ndarray

```
easycv.core.post_processing.pose_transforms.transform_preds(coords, center, scale, output_size,
                                                           use_udp=False)
```

Get final keypoint predictions from heatmaps and apply scaling and translation to map them back to the image.

Note: num_keypoints: K

Parameters

- **coords** (*np.ndarray* [K, ndims]) –

- If ndims=2, corrd is predicted keypoint location.
- If ndims=4, corrd is composed of (x, y, scores, tags)
- If ndims=5, corrd is composed of (x, y, scores, tags, flipped_tags)
- **center** (*np.ndarray*[2,]) – Center of the bounding box (x, y).
- **scale** (*np.ndarray*[2,]) – Scale of the bounding box wrt [width, height].
- **output_size** (*np.ndarray*[2,] | *list*(2,)) – Size of the destination heatmaps.
- **use_udp** (*bool*) – Use unbiased data processing

Returns Predicted coordinates in the images.

Return type *np.ndarray*

`easycv.core.post_processing.pose_transforms.get_affine_transform(center, scale, rot, output_size, shift=(0.0, 0.0), inv=False)`

Get the affine transform matrix, given the center/scale/rot/output_size.

Parameters

- **center** (*np.ndarray*[2,]) – Center of the bounding box (x, y).
- **scale** (*np.ndarray*[2,]) – Scale of the bounding box wrt [width, height].
- **rot** (*float*) – Rotation angle (degree).
- **output_size** (*np.ndarray*[2,] | *list*(2,)) – Size of the destination heatmaps.
- **shift** (0-100%) – Shift translation ratio wrt the width/height. Default (0., 0.).
- **inv** (*bool*) – Option to inverse the affine transform direction. (inv=False: src->dst or inv=True: dst->src)

Returns The transform matrix.

Return type *np.ndarray*

`easycv.core.post_processing.pose_transforms.affine_transform(pt, trans_mat)`

Apply an affine transformation to the points.

Parameters

- **pt** (*np.ndarray*) – a 2 dimensional point to be transformed
- **trans_mat** (*np.ndarray*) – 2x3 matrix of an affine transform

Returns Transformed points.

Return type *np.ndarray*

`easycv.core.post_processing.pose_transforms.rotate_point(pt, angle_rad)`

Rotate a point by an angle.

Parameters

- **pt** (*list*[*float*]) – 2 dimensional point to be rotated
- **angle_rad** (*float*) – rotation angle by radian

Returns Rotated point.

Return type *list*[*float*]

`easycv.core.post_processing.pose_transforms.get_warp_matrix(theta, size_input, size_dst, size_target)`

Calculate the transformation matrix under the constraint of unbiased. Paper ref: Huang et al. The Devil is in the Details: Delving into Unbiased Data Processing for Human Pose Estimation (CVPR 2020).

Parameters

- **theta** (*float*) – Rotation angle in degrees.
- **size_input** (*np.ndarray*) – Size of input image [w, h].
- **size_dst** (*np.ndarray*) – Size of output image [w, h].
- **size_target** (*np.ndarray*) – Size of ROI in input plane [w, h].

Returns A matrix for transformation.

Return type matrix (*np.ndarray*)

`easycv.core.post_processing.pose_transforms.warp_affine_joints(joints, mat)`

Apply affine transformation defined by the transform matrix on the joints.

Parameters

- **joints** (*np.ndarray[... , 2]*) – Origin coordinate of joints.
- **mat** (*np.ndarray[3, 2]*) – The affine matrix.

Returns Result coordinate of joints.

Return type matrix (*np.ndarray[... , 2]*)

25.1.4 easycv.core.visualization package

`easycv.core.visualization.imshow_bboxes(img, bboxes, labels=None, colors='green', text_color='white', font_size=20, thickness=1, font_scale=0.5, show=True, win_name="", wait_time=0, out_file=None)`

Draw bboxes with labels (optional) on an image. This is a wrapper of `mmcv.imshow_bboxes`.

Parameters

- **img** (*str or ndarray*) – The image to be displayed.
- **bboxes** (*ndarray*) – ndarray of shape (k, 4), each row is a bbox in format [x1, y1, x2, y2].
- **labels** (*str or list[str], optional*) – labels of each bbox.
- **colors** (*list[str or tuple or Color]*) – A list of colors.
- **text_color** (*str or tuple or Color*) – Color of texts.
- **font_size** (*int*) – Size of font.
- **thickness** (*int*) – Thickness of lines.
- **font_scale** (*float*) – Font scales of texts.
- **show** (*bool*) – Whether to show the image.
- **win_name** (*str*) – The window name.
- **wait_time** (*int*) – Value of waitKey param.
- **out_file** (*str, optional*) – The filename to write the image.

Returns The image with bboxes drawn on it.

Return type ndarray

`easycv.core.visualization.imshow_keypoints`(*img*, *pose_result*, *skeleton=None*, *kpt_score_thr=0.3*,
pose_kpt_color=None, *pose_link_color=None*, *radius=4*,
thickness=1, *show_keypoint_weight=False*)

Draw keypoints and links on an image.

Parameters

- **img** (*str* or *Tensor*) – The image to draw poses on. If an image array is given, it will be modified in-place.
- **pose_result** (*list[kpts]*) – The poses to draw. Each element *kpts* is a set of *K* keypoints as an *Kx3* numpy.ndarray, where each keypoint is represented as *x*, *y*, *score*.
- **kpt_score_thr** (*float*, *optional*) – Minimum score of keypoints to be shown. Default: 0.3.
- **pose_kpt_color** (*np.array[Nx3]*) – Color of *N* keypoints. If *None*, the keypoint will not be drawn.
- **pose_link_color** (*np.array[Mx3]*) – Color of *M* links. If *None*, the links will not be drawn.
- **thickness** (*int*) – Thickness of lines.

`easycv.core.visualization.imshow_label`(*img*, *labels*, *text_color='blue'*, *font_size=20*, *thickness=1*,
font_scale=0.5, *interval=5*, *show=True*, *win_name=""*,
wait_time=0, *out_file=None*)

Draw images with labels on an image.

Parameters

- **img** (*str* or *ndarray*) – The image to be displayed.
- **labels** (*str* or *list[str]*) – labels of each image.
- **text_color** (*str* or *tuple* or *Color*) – Color of texts.
- **font_size** (*int*) – Size of font.
- **thickness** (*int*) – Thickness of lines.
- **font_scale** (*float*) – Font scales of texts.
- **interval** (*int*) – interval pixels between multiple labels
- **show** (*bool*) – Whether to show the image.
- **win_name** (*str*) – The window name.
- **wait_time** (*int*) – Value of waitKey param.
- **out_file** (*str*, *optional*) – The filename to write the image.

Returns The image with bboxes drawn on it.

Return type ndarray

Submodules

easycv.core.visualization.image module

`easycv.core.visualization.image.get_font_path()`

`easycv.core.visualization.image.put_text(img, xy, text, fill, size=20)`
support chinese text

`easycv.core.visualization.image.imshow_label(img, labels, text_color='blue', font_size=20, thickness=1, font_scale=0.5, interval=5, show=True, win_name="", wait_time=0, out_file=None)`

Draw images with labels on an image.

Parameters

- **img** (*str or ndarray*) – The image to be displayed.
- **labels** (*str or list[str]*) – labels of each image.
- **text_color** (*str or tuple or Color*) – Color of texts.
- **font_size** (*int*) – Size of font.
- **thickness** (*int*) – Thickness of lines.
- **font_scale** (*float*) – Font scales of texts.
- **interval** (*int*) – interval pixels between multiple labels
- **show** (*bool*) – Whether to show the image.
- **win_name** (*str*) – The window name.
- **wait_time** (*int*) – Value of waitKey param.
- **out_file** (*str, optional*) – The filename to write the image.

Returns The image with bboxes drawn on it.

Return type ndarray

`easycv.core.visualization.image.imshow_bboxes(img, bboxes, labels=None, colors='green', text_color='white', font_size=20, thickness=1, font_scale=0.5, show=True, win_name="", wait_time=0, out_file=None)`

Draw bboxes with labels (optional) on an image. This is a wrapper of `mmcv.imshow_bboxes`.

Parameters

- **img** (*str or ndarray*) – The image to be displayed.
- **bboxes** (*ndarray*) – ndarray of shape (k, 4), each row is a bbox in format [x1, y1, x2, y2].
- **labels** (*str or list[str], optional*) – labels of each bbox.
- **colors** (*list[str or tuple or Color]*) – A list of colors.
- **text_color** (*str or tuple or Color*) – Color of texts.
- **font_size** (*int*) – Size of font.
- **thickness** (*int*) – Thickness of lines.
- **font_scale** (*float*) – Font scales of texts.

- **show** (*bool*) – Whether to show the image.
- **win_name** (*str*) – The window name.
- **wait_time** (*int*) – Value of waitKey param.
- **out_file** (*str*, *optional*) – The filename to write the image.

Returns The image with bboxes drawn on it.

Return type ndarray

```
easycv.core.visualization.image.imshow_keypoints(img, pose_result, skeleton=None, kpt_score_thr=0.3,  
                                                  pose_kpt_color=None, pose_link_color=None,  
                                                  radius=4, thickness=1,  
                                                  show_keypoint_weight=False)
```

Draw keypoints and links on an image.

Parameters

- **img** (*str or Tensor*) – The image to draw poses on. If an image array is given, it will be modified in-place.
- **pose_result** (*list[kpts]*) – The poses to draw. Each element kpts is a set of K keypoints as an Kx3 numpy.ndarray, where each keypoint is represented as x, y, score.
- **kpt_score_thr** (*float, optional*) – Minimum score of keypoints to be shown. Default: 0.3.
- **pose_kpt_color** (*np.array[Nx3]*) – Color of N keypoints. If None, the keypoint will not be drawn.
- **pose_link_color** (*np.array[Mx3]*) – Color of M links. If None, the links will not be drawn.
- **thickness** (*int*) – Thickness of lines.

25.2 Submodules

25.3 easycv.core.standard_fields module

Contains classes specifying naming conventions used for object detection.

Specifies: InputDataFields: standard fields used by reader/preprocessor/batcher. DetectionResultFields: standard fields returned by object detector. BoxListFields: standard field used by BoxList TfExampleFields: standard fields for tf-example data format (go/tf-example).

class easycv.core.standard_fields.InputDataFields

Bases: object

Names for the input tensors.

Holds the standard data field names to use for identifying input tensors. This should be used by the decoder to identify keys for the returned tensor_dict containing input tensors. And it should be used by the model to identify the tensors it needs.

image

image.

original_image

image in the original input size.

| | |
|--|---|
| key | unique key corresponding to image. |
| source_id | source of the original image. |
| filename | original filename of the dataset (without common path). |
| groundtruth_image_classes | image-level class labels. |
| groundtruth_boxes | coordinates of the ground truth boxes in the image. |
| groundtruth_classes | box-level class labels. |
| groundtruth_label_types | box-level label types (e.g. explicit negative). |
| groundtruth_is_crowd | [DEPRECATED, use <code>groundtruth_group_of</code> instead] is the groundtruth a single object or a crowd. |
| groundtruth_area | area of a groundtruth segment. |
| groundtruth_difficult | is a <i>difficult</i> object |
| groundtruth_group_of | is a <i>group_of</i> objects, e.g. multiple objects of the same class, forming a connected group, where instances are heavily occluding each other. |
| proposal_boxes | coordinates of object proposal boxes. |
| proposal_objectness | objectness score of each proposal. |
| groundtruth_instance_masks | ground truth instance masks. |
| groundtruth_instance_boundaries | ground truth instance boundaries. |
| groundtruth_instance_classes | instance mask-level class labels. |
| groundtruth_keypoints | ground truth keypoints. |
| groundtruth_keypoint_visibilities | ground truth keypoint visibilities. |
| groundtruth_label_scores | groundtruth label scores. |
| groundtruth_weights | groundtruth weight factor for bounding boxes. |
| num_groundtruth_boxes | number of groundtruth boxes. |

`true_image_shapes`

true shapes of images in the resized images, as resized images can be padded with zeros.

```

label_map = 'label_map'
char_dict = 'char_dict'
class easycv.core.standard_fields.DetectionResultFields
    Bases: object
    Naming conventions for storing the output of the detector.
    source_id
        source of the original image.
    key
        unique key corresponding to image.
    detection_boxes
        coordinates of the detection boxes in the image.
    detection_scores
        detection scores for the detection boxes in the image.
    detection_classes
        detection-level class labels.
    detection_masks
        contains a segmentation mask for each detection box.
    detection_boundaries
        contains an object boundary for each detection box.
    detection_keypoints
        contains detection keypoints for each detection box.
    num_detections
        number of detections in the batch.
    source_id = 'source_id'
    key = 'key'
    detection_boxes = 'detection_boxes'
    detection_scores = 'detection_scores'
    detection_classes = 'detection_classes'
    detection_masks = 'detection_masks'
    detection_boundaries = 'detection_boundaries'
    detection_keypoints = 'detection_keypoints'
    num_detections = 'num_detections'
class easycv.core.standard_fields.TfExampleFields
    Bases: object
    TF-example proto feature names for object detection.
    Holds the standard feature names to load from an Example proto for object detection.
    image_encoded
        JPEG encoded string
    image_format
        image format, e.g. "JPEG"

```

filename
filename

channels
number of channels of image

colorspace
colorspace, e.g. “RGB”

height
height of image in pixels, e.g. 462

width
width of image in pixels, e.g. 581

source_id
original source of the image

object_class_text
labels in text format, e.g. [“person”, “cat”]

object_class_label
labels in numbers, e.g. [16, 8]

object_bbox_xmin
xmin coordinates of groundtruth box, e.g. 10, 30

object_bbox_xmax
xmax coordinates of groundtruth box, e.g. 50, 40

object_bbox_ymin
ymin coordinates of groundtruth box, e.g. 40, 50

object_bbox_ymax
ymax coordinates of groundtruth box, e.g. 80, 70

object_view
viewpoint of object, e.g. [“frontal”, “left”]

object_truncated
is object truncated, e.g. [true, false]

object_occluded
is object occluded, e.g. [true, false]

object_difficult
is object difficult, e.g. [true, false]

object_group_of
is object a single object or a group of objects

object_depiction
is object a depiction

object_is_crowd
[DEPRECATED, use object_group_of instead] is the object a single object or a crowd

object_segment_area
the area of the segment.

object_weight
a weight factor for the object’s bounding box.

instance_masks
instance segmentation masks.

instance_boundaries
instance boundaries.

instance_classes
Classes for each instance segmentation mask.

detection_class_label
class label in numbers.

detection_bbox_ymin
ymin coordinates of a detection box.

detection_bbox_xmin
xmin coordinates of a detection box.

detection_bbox_ymax
ymax coordinates of a detection box.

detection_bbox_xmax
xmax coordinates of a detection box.

detection_score
detection score for the class label and box.

EASYCV.MODELS PACKAGE

26.1 Subpackages

26.1.1 easycv.models.backbones package

Submodules

easycv.models.backbones.benchmark_mlp module

```
class easycv.models.backbones.benchmark_mlp.BenchMarkMLP(feature_num, num_classes=1000,  
                                                         avg_pool=False, **kwargs)
```

Bases: torch.nn.modules.module.Module

```
__init__(feature_num, num_classes=1000, avg_pool=False, **kwargs)  
    Initializes internal Module state, shared by both nn.Module and ScriptModule.
```

```
init_weights()
```

```
forward(x)  
    Defines the computation performed at every call.  
    Should be overridden by all subclasses.
```

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

```
training: bool
```

easycv.models.backbones.bninception module

This model is taken from the official PyTorch model zoo. - torchvision.models.mobilenet.py on 31th Aug, 2019

```
class easycv.models.backbones.bninception.BNInception(num_classes=0)
```

Bases: torch.nn.modules.module.Module

```
__init__(num_classes=0)  
    Initializes internal Module state, shared by both nn.Module and ScriptModule.
```

```
init_weights()
```

```
features(input)
```

logits(*features*)

forward(*input*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

easycv.models.backbones.darknet module

```
class easycv.models.backbones.darknet.Darknet(depth, in_channels=3, stem_out_channels=32,  
                                              out_features=('dark3', 'dark4', 'dark5'))
```

Bases: `torch.nn.modules.module.Module`

depth2blocks = {21: [1, 2, 2, 1], 53: [2, 8, 8, 4]}

```
__init__(depth, in_channels=3, stem_out_channels=32, out_features=('dark3', 'dark4', 'dark5'))
```

Parameters

- **depth** (*int*) – depth of darknet used in model, usually use [21, 53] for this param.
- **in_channels** (*int*) – number of input channels, for example, use 3 for RGB image.
- **stem_out_channels** (*int*) – number of output channels of darknet stem. It decides channels of darknet layer2 to layer5.
- **out_features** (*Tuple[str]*) – desired output layer name.

make_group_layer(*in_channels: int, num_blocks: int, stride: int = 1*)

starts with conv layer then has *num_blocks* `ResLayer`

make_spp_block(*filters_list, in_filters*)

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

```
class easycv.models.backbones.darknet.CSPDarknet(dep_mul, wid_mul, out_features=('dark3', 'dark4',  
                                         'dark5'), depthwise=False, act='silu',  
                                         spp_type='spp')
```

Bases: `torch.nn.modules.module.Module`

```
__init__(dep_mul, wid_mul, out_features=('dark3', 'dark4', 'dark5'), depthwise=False, act='silu',  
         spp_type='spp')
```

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

easycv.models.backbones.genet module

easycv.models.backbones.hrnet module

```
easycv.models.backbones.hrnet.get_expansion(block, expansion=None)
    Get the expansion of a residual block.
```

The block expansion will be obtained by the following order:

1. If `expansion` is given, just return it.
2. If `block` has the attribute `expansion`, then return `block.expansion`.
3. Return the default value according the the block type: 1 for `BasicBlock` and 4 for `Bottleneck`.

Parameters

- **block** (*class*) – The block class.
- **expansion** (*int* / *None*) – The given expansion ratio.

Returns The expansion of the block.

Return type `int`

```
class easycv.models.backbones.hrnet.Bottleneck(in_channels, out_channels, expansion=4, stride=1,
                                                dilation=1, downsample=None, style='pytorch',
                                                with_cp=False, conv_cfg=None, norm_cfg='type':
                                                'BN')
```

Bases: `torch.nn.modules.module.Module`

Bottleneck block for ResNet.

Parameters

- **in_channels** (*int*) – Input channels of this block.
- **out_channels** (*int*) – Output channels of this block.
- **expansion** (*int*) – The ratio of `out_channels/mid_channels` where `mid_channels` is the input/output channels of conv2. Default: 4.

- **stride** (*int*) – stride of the block. Default: 1
- **dilation** (*int*) – dilation of convolution. Default: 1
- **downsample** (*nn.Module*) – downsample operation on identity branch. Default: None.
- **style** (*str*) – "pytorch" or "caffe". If set to "pytorch", the stride-two layer is the 3x3 conv layer, otherwise the stride-two layer is the first 1x1 conv layer. Default: "pytorch".
- **with_cp** (*bool*) – Use checkpoint or not. Using checkpoint will save some memory while slowing down the training speed.
- **conv_cfg** (*dict*) – dictionary to construct and config conv layer. Default: None
- **norm_cfg** (*dict*) – dictionary to construct and config norm layer. Default: dict(type='BN')

__init__ (*in_channels, out_channels, expansion=4, stride=1, dilation=1, downsample=None, style='pytorch', with_cp=False, conv_cfg=None, norm_cfg={'type': 'BN'}*)
 Initializes internal Module state, shared by both nn.Module and ScriptModule.

property norm1
 the normalization layer named "norm1"

Type nn.Module

property norm2
 the normalization layer named "norm2"

Type nn.Module

property norm3
 the normalization layer named "norm3"

Type nn.Module

forward (*x*)
 Forward function.

training: bool

class easycv.models.backbones.hrnet.**HRModule** (*num_branches, blocks, num_blocks, in_channels, num_channels, multiscale_output=False, with_cp=False, conv_cfg=None, norm_cfg={'type': 'BN'}, upsample_cfg={'align_corners': None, 'mode': 'nearest'}*)

Bases: torch.nn.modules.module.Module

High-Resolution Module for HRNet.

In this module, every branch has 4 BasicBlocks/Bottlenecks. Fusion/Exchange is in this module.

__init__ (*num_branches, blocks, num_blocks, in_channels, num_channels, multiscale_output=False, with_cp=False, conv_cfg=None, norm_cfg={'type': 'BN'}, upsample_cfg={'align_corners': None, 'mode': 'nearest'}*)
 Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward (*x*)
 Forward function.

training: bool

```
class easycv.models.backbones.hrnet.HRNet(arch='w32', extra=None, in_channels=3, conv_cfg=None,
                                          norm_cfg={'type': 'BN'}, norm_eval=False, with_cp=False,
                                          zero_init_residual=False, multi_scale_output=False)
```

Bases: `torch.nn.modules.module.Module`

HRNet backbone.

High-Resolution Representations for Labeling Pixels and Regions

Parameters

- **extra** (*dict*) – detailed configuration for each stage of HRNet.
- **in_channels** (*int*) – Number of input image channels. Default: 3.
- **conv_cfg** (*dict*) – dictionary to construct and config conv layer.
- **norm_cfg** (*dict*) – dictionary to construct and config norm layer.
- **norm_eval** (*bool*) – Whether to set norm layers to eval mode, namely, freeze running stats (mean and var). Note: Effect on Batch Norm and its variants only. Default: False
- **with_cp** (*bool*) – Use checkpoint or not. Using checkpoint will save some memory while slowing down the training speed.
- **zero_init_residual** (*bool*) – whether to use zero init for last norm layer in resblocks to let them behave as identity.

Example

```
>>> from mmpose.models import HRNet
>>> import torch
>>> extra = dict(
>>>     stage1=dict(
>>>         num_modules=1,
>>>         num_branches=1,
>>>         block='BOTTLENECK',
>>>         num_blocks=(4, ),
>>>         num_channels=(64, )),
>>>     stage2=dict(
>>>         num_modules=1,
>>>         num_branches=2,
>>>         block='BASIC',
>>>         num_blocks=(4, 4),
>>>         num_channels=(32, 64)),
>>>     stage3=dict(
>>>         num_modules=4,
>>>         num_branches=3,
>>>         block='BASIC',
>>>         num_blocks=(4, 4, 4),
>>>         num_channels=(32, 64, 128)),
>>>     stage4=dict(
>>>         num_modules=3,
>>>         num_branches=4,
>>>         block='BASIC',
>>>         num_blocks=(4, 4, 4, 4),
>>>         num_channels=(32, 64, 128, 256)))
```

(continues on next page)

(continued from previous page)

```

```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

property norm1

the normalization layer named “norm1”

Type nn.Module

property norm2

the normalization layer named “norm2”

Type nn.Module

init_weights()

forward(x)

Forward function.

train(mode=True)

Convert the model into training mode.

training: bool

parse_arch(arch, extra=None)

easycv.models.backbones.inceptionv3 module

This model is taken from the official PyTorch model zoo. - torchvision.models.inception.py on 31th Aug, 2019

```
class easycv.models.backbones.inceptionv3.Inception3(num_classes: int = 0, aux_logits: bool = True,
                                                    transform_input: bool = False)
```

Bases: torch.nn.modules.module.Module

```
__init__(num_classes: int = 0, aux_logits: bool = True, transform_input: bool = False) → None
```

Parameters

- **num_classes** – number of classes based on dataset.
- **aux_logits** – If True, adds two auxiliary branches that can improve training. Default: *False* when pretrained is True otherwise *True*
- **transform_input** – If True, preprocesses the input according to the method with which it was trained on ImageNet. Default: *False*

init_weights()

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

easycv.models.backbones.lightrnet module

```
easycv.models.backbones.lightrnet.channel_shuffle(x, groups)
```

Channel Shuffle operation.

This function enables cross-group information flow for multiple groups convolution layers.

Parameters

- **x** (*Tensor*) – The input tensor.
- **groups** (*int*) – The number of groups to divide the input tensor in the channel dimension.

Returns The output tensor after channel shuffle operation.

Return type Tensor

```
class easycv.models.backbones.lightrnet.SpatialWeighting(channels, ratio=16, conv_cfg=None,
                                                         norm_cfg=None, act_cfg=({'type':
                                                         'ReLU'}, {'type': 'Sigmoid'}))
```

Bases: torch.nn.modules.module.Module

Spatial weighting module.

Parameters

- **channels** (*int*) – The channels of the module.

- **ratio** (*int*) – channel reduction ratio.
- **conv_cfg** (*dict*) – Config dict for convolution layer. Default: None, which means using conv2d.
- **norm_cfg** (*dict*) – Config dict for normalization layer. Default: None.
- **act_cfg** (*dict*) – Config dict for activation layer. Default: (dict(type='ReLU'), dict(type='Sigmoid')). The last ConvModule uses Sigmoid by default.

__init__(*channels, ratio=16, conv_cfg=None, norm_cfg=None, act_cfg=({'type': 'ReLU'}, {'type': 'Sigmoid'})*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.backbones.lighthrnet.CrossResolutionWeighting(channels, ratio=16,
                                                                conv_cfg=None,
                                                                norm_cfg=None,
                                                                act_cfg=({'type': 'ReLU'},
                                                                {'type': 'Sigmoid'}))
```

Bases: torch.nn.modules.module.Module

Cross-resolution channel weighting module.

Parameters

- **channels** (*int*) – The channels of the module.
- **ratio** (*int*) – channel reduction ratio.
- **conv_cfg** (*dict*) – Config dict for convolution layer. Default: None, which means using conv2d.
- **norm_cfg** (*dict*) – Config dict for normalization layer. Default: None.
- **act_cfg** (*dict*) – Config dict for activation layer. Default: (dict(type='ReLU'), dict(type='Sigmoid')). The last ConvModule uses Sigmoid by default.

__init__(*channels, ratio=16, conv_cfg=None, norm_cfg=None, act_cfg=({'type': 'ReLU'}, {'type': 'Sigmoid'})*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.backbones.lighthrnet.ConditionalChannelWeighting(in_channels, stride,  
                                                                    reduce_ratio,  
                                                                    conv_cfg=None,  
                                                                    norm_cfg={'type': 'BN'},  
                                                                    with_cp=False)
```

Bases: torch.nn.modules.module.Module

Conditional channel weighting block.

Parameters

- **in_channels** (*int*) – The input channels of the block.
- **stride** (*int*) – Stride of the 3x3 convolution layer.
- **reduce_ratio** (*int*) – channel reduction ratio.
- **conv_cfg** (*dict*) – Config dict for convolution layer. Default: None, which means using conv2d.
- **norm_cfg** (*dict*) – Config dict for normalization layer. Default: dict(type='BN').
- **with_cp** (*bool*) – Use checkpoint or not. Using checkpoint will save some memory while slowing down the training speed. Default: False.

```
__init__(in_channels, stride, reduce_ratio, conv_cfg=None, norm_cfg={'type': 'BN'}, with_cp=False)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.backbones.lighthrnet.Stem(in_channels, stem_channels, out_channels,  
                                              expand_ratio, conv_cfg=None, norm_cfg={'type': 'BN'},  
                                              with_cp=False)
```

Bases: torch.nn.modules.module.Module

Stem network block.

Parameters

- **in_channels** (*int*) – The input channels of the block.
- **stem_channels** (*int*) – Output channels of the stem layer.
- **out_channels** (*int*) – The output channels of the block.
- **expand_ratio** (*int*) – adjusts number of channels of the hidden layer in InvertedResidual by this amount.
- **conv_cfg** (*dict*) – Config dict for convolution layer. Default: None, which means using conv2d.
- **norm_cfg** (*dict*) – Config dict for normalization layer. Default: dict(type='BN').

- **with_cp** (*bool*) – Use checkpoint or not. Using checkpoint will save some memory while slowing down the training speed. Default: False.

__init__ (*in_channels, stem_channels, out_channels, expand_ratio, conv_cfg=None, norm_cfg={'type': 'BN'}, with_cp=False*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward (*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: *bool*

class easycv.models.backbones.lighthrnet.**IterativeHead** (*in_channels, norm_cfg={'type': 'BN'}*)

Bases: torch.nn.modules.module.Module

Extra iterative head for feature learning.

Parameters

- **in_channels** (*int*) – The input channels of the block.
- **norm_cfg** (*dict*) – Config dict for normalization layer. Default: dict(type='BN').

__init__ (*in_channels, norm_cfg={'type': 'BN'}*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward (*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: *bool*

class easycv.models.backbones.lighthrnet.**ShuffleUnit** (*in_channels, out_channels, stride=1, conv_cfg=None, norm_cfg={'type': 'BN'}, act_cfg={'type': 'ReLU'}, with_cp=False*)

Bases: torch.nn.modules.module.Module

InvertedResidual block for ShuffleNetV2 backbone.

Parameters

- **in_channels** (*int*) – The input channels of the block.
- **out_channels** (*int*) – The output channels of the block.
- **stride** (*int*) – Stride of the 3x3 convolution layer. Default: 1
- **conv_cfg** (*dict*) – Config dict for convolution layer. Default: None, which means using conv2d.

- **norm_cfg** (*dict*) – Config dict for normalization layer. Default: `dict(type='BN')`.
- **act_cfg** (*dict*) – Config dict for activation layer. Default: `dict(type='ReLU')`.
- **with_cp** (*bool*) – Use checkpoint or not. Using checkpoint will save some memory while slowing down the training speed. Default: `False`.

__init__ (*in_channels, out_channels, stride=1, conv_cfg=None, norm_cfg={'type': 'BN'}, act_cfg={'type': 'ReLU'}, with_cp=False*)

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

forward (*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

class `easycv.models.backbones.lighthrnet.LiteHRModule` (*num_branches, num_blocks, in_channels, reduce_ratio, module_type, multiscale_output=False, with_fuse=True, conv_cfg=None, norm_cfg={'type': 'BN'}, with_cp=False*)

Bases: `torch.nn.modules.module.Module`

High-Resolution Module for LiteHRNet.

It contains conditional channel weighting blocks and shuffle blocks.

Parameters

- **num_branches** (*int*) – Number of branches in the module.
- **num_blocks** (*int*) – Number of blocks in the module.
- **in_channels** (*list(int)*) – Number of input image channels.
- **reduce_ratio** (*int*) – Channel reduction ratio.
- **module_type** (*str*) – ‘LITE’ or ‘NAIVE’
- **multiscale_output** (*bool*) – Whether to output multi-scale features.
- **with_fuse** (*bool*) – Whether to use fuse layers.
- **conv_cfg** (*dict*) – dictionary to construct and config conv layer.
- **norm_cfg** (*dict*) – dictionary to construct and config norm layer.
- **with_cp** (*bool*) – Use checkpoint or not. Using checkpoint will save some memory while slowing down the training speed.

__init__ (*num_branches, num_blocks, in_channels, reduce_ratio, module_type, multiscale_output=False, with_fuse=True, conv_cfg=None, norm_cfg={'type': 'BN'}, with_cp=False*)

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

forward (*x*)

Forward function.

training: `bool`

```
class easycv.models.backbones.lighthrnet.LiteHRNet(extra, in_channels=3, conv_cfg=None,
                                                    norm_cfg={'type': 'BN'}, norm_eval=False,
                                                    with_cp=False)
```

Bases: `torch.nn.modules.module.Module`

Lite-HRNet backbone.

Lite-HRNet: A Lightweight High-Resolution Network

Code adapted from '<https://github.com/HRNet/Lite-HRNet/>' 'blob/hrnet/models/backbones/lighthrnet.py'

Parameters

- **extra** (*dict*) – detailed configuration for each stage of HRNet.
- **in_channels** (*int*) – Number of input image channels. Default: 3.
- **conv_cfg** (*dict*) – dictionary to construct and config conv layer.
- **norm_cfg** (*dict*) – dictionary to construct and config norm layer.
- **norm_eval** (*bool*) – Whether to set norm layers to eval mode, namely, freeze running stats (mean and var). Note: Effect on Batch Norm and its variants only. Default: False
- **with_cp** (*bool*) – Use checkpoint or not. Using checkpoint will save some memory while slowing down the training speed.

Example

```
>>> from mmpose.models import LiteHRNet
>>> import torch
>>> extra=dict(
>>>     stem=dict(stem_channels=32, out_channels=32, expand_ratio=1),
>>>     num_stages=3,
>>>     stages_spec=dict(
>>>         num_modules=(2, 4, 2),
>>>         num_branches=(2, 3, 4),
>>>         num_blocks=(2, 2, 2),
>>>         module_type=('LITE', 'LITE', 'LITE'),
>>>         with_fuse=(True, True, True),
>>>         reduce_ratios=(8, 8, 8),
>>>         num_channels=(
>>>             (40, 80),
>>>             (40, 80, 160),
>>>             (40, 80, 160, 320),
>>>         )),
>>>     with_head=False)
>>> self = LiteHRNet(extra, in_channels=1)
>>> self.eval()
>>> inputs = torch.rand(1, 1, 32, 32)
>>> level_outputs = self.forward(inputs)
>>> for level_out in level_outputs:
...     print(tuple(level_out.shape))
(1, 40, 8, 8)
```

```
__init__(extra, in_channels=3, conv_cfg=None, norm_cfg={'type': 'BN'}, norm_eval=False,
         with_cp=False)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights()

Initialize the weights in backbone.

Parameters `pretrained` (*str*, *optional*) – Path to pre-trained weights. Defaults to None.

forward(*x*)

Forward function.

train(*mode=True*)

Convert the model into training mode.

training: `bool`

easycv.models.backbones.mae_vit_transformer module

Mostly copy-paste from https://github.com/facebookresearch/mae/blob/main/models_mae.py

```
class easycv.models.backbones.mae_vit_transformer.MaskedAutoencoderViT(img_size=224,
                                                                    patch_size=16,
                                                                    in_chans=3,
                                                                    embed_dim=1024,
                                                                    depth=24,
                                                                    num_heads=16,
                                                                    mlp_ratio=4.0,
                                                                    norm_layer=functools.partial(<class
                                                                    'torch.nn.modules.normalization.LayerNorm'
                                                                    eps=1e-06))
```

Bases: `torch.nn.modules.module.Module`

Masked Autoencoder with VisionTransformer backbone. MaskedAutoencoderViT is mostly same as vit_tranformer_dynamic, but with a random_masking func. MaskedAutoencoderViT model can be loaded by vit_tranformer_dynamic.

Parameters

- **img_size** (*int*) – input image size
- **patch_size** (*int*) – patch size
- **in_chans** (*int*) – input image channels
- **embed_dim** (*int*) – feature dimensions
- **depth** (*int*) – number of encoder layers
- **num_heads** (*int*) – Parallel attention heads
- **mlp_ratio** (*float*) – mlp ratio
- **norm_layer** – type of normalization layer

```
__init__(img_size=224, patch_size=16, in_chans=3, embed_dim=1024, depth=24, num_heads=16,
         mlp_ratio=4.0, norm_layer=functools.partial(<class
         'torch.nn.modules.normalization.LayerNorm'>, eps=1e-06))
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights()

random_masking(*x*, *mask_ratio*)

Perform per-sample random masking by per-sample shuffling. Per-sample shuffling is done by argsort random noise. *x*: [N, L, D], sequence

forward(*x*, *mask_ratio*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

easycv.models.backbones.mnasnet module

This model is taken from the official PyTorch model zoo. - torchvision.models.mnasnet.py on 31th Aug, 2019

class easycv.models.backbones.mnasnet.**MNASNet**(*alpha*, *num_classes=0*, *dropout=0.2*)

Bases: torch.nn.modules.module.Module

MNASNet, as described in <https://arxiv.org/pdf/1807.11626.pdf>. >>> model = MNASNet(1000, 1.0) >>> x = torch.rand(1, 3, 224, 224) >>> y = model(x) >>> y.dim() 1 >>> y.nelement() 1000

__init__(*alpha*, *num_classes=0*, *dropout=0.2*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

init_weights()

training: bool

easycv.models.backbones.mobilenetv2 module

This model is taken from the official PyTorch model zoo. - torchvision.models.mobilenet.py on 31th Aug, 2019

class easycv.models.backbones.mobilenetv2.**MobileNetV2**(*num_classes=0*, *width_multi=1.0*, *inverted_residual_setting=None*, *round_nearest=8*)

Bases: torch.nn.modules.module.Module

__init__(*num_classes=0*, *width_multi=1.0*, *inverted_residual_setting=None*, *round_nearest=8*)

MobileNet V2 main class :param num_classes: Number of classes :type num_classes: int :param width_multi: Width multiplier - adjusts number of channels in each layer by this amount :type width_multi: float :param inverted_residual_setting: Network structure :param round_nearest: Round the number of channels in each layer to be a multiple of this number :type round_nearest: int :param Set to 1 to turn off rounding:

init_weights()

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

easycv.models.backbones.network_blocks module

class easycv.models.backbones.network_blocks.SiLU(*inplace=True*)

Bases: torch.nn.modules.module.Module

export-friendly inplace version of nn.SiLU()

__init__(*inplace=True*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

static forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

class easycv.models.backbones.network_blocks.HSiLU(*inplace=True*)

Bases: torch.nn.modules.module.Module

export-friendly inplace version of nn.SiLU() hardsigmoid is better than sigmoid when used for edge model

__init__(*inplace=True*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

static forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

easycv.models.backbones.network_blocks.get_activation(*name='silu', inplace=True*)

class easycv.models.backbones.network_blocks.BaseConv(*in_channels, out_channels, ksize, stride,*
groups=1, bias=False, act='silu')

Bases: torch.nn.modules.module.Module

A Conv2d -> Batchnorm -> silu/leaky relu block

__init__(*in_channels, out_channels, ksize, stride, groups=1, bias=False, act='silu'*)
 Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*)
 Defines the computation performed at every call.
 Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

fuseforward(*x*)

training: bool

class easycv.models.backbones.network_blocks.**DWConv**(*in_channels, out_channels, ksize, stride=1, act='silu'*)

Bases: torch.nn.modules.module.Module

Depthwise Conv + Conv

__init__(*in_channels, out_channels, ksize, stride=1, act='silu'*)
 Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*)
 Defines the computation performed at every call.
 Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.backbones.network_blocks.**Bottleneck**(*in_channels, out_channels, shortcut=True, expansion=0.5, depthwise=False, act='silu'*)

Bases: torch.nn.modules.module.Module

__init__(*in_channels, out_channels, shortcut=True, expansion=0.5, depthwise=False, act='silu'*)
 Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*)
 Defines the computation performed at every call.
 Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.backbones.network_blocks.ResLayer(in_channels: int)
```

Bases: torch.nn.modules.module.Module

Residual layer with *in_channels* inputs.

```
__init__(in_channels: int)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
forward(x)
```

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.backbones.network_blocks.SPPFBottleneck(in_channels, out_channels,
                                                             kernel_size=5, activation='silu')
```

Bases: torch.nn.modules.module.Module

Spatial pyramid pooling layer used in YOLOv3-SPP

```
__init__(in_channels, out_channels, kernel_size=5, activation='silu')
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
forward(x)
```

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.backbones.network_blocks.SPPFBottleneck(in_channels, out_channels,
                                                             kernel_sizes=(5, 9, 13),
                                                             activation='silu')
```

Bases: torch.nn.modules.module.Module

Spatial pyramid pooling layer used in YOLOv3-SPP

```
__init__(in_channels, out_channels, kernel_sizes=(5, 9, 13), activation='silu')
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
forward(x)
```

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.backbones.network_blocks.CSPLayer(in_channels, out_channels, n=1,
                                                    shortcut=True, expansion=0.5,
                                                    depthwise=False, act='silu')
```

Bases: torch.nn.modules.module.Module

CSP Bottleneck with 3 convolutions

```
__init__(in_channels, out_channels, n=1, shortcut=True, expansion=0.5, depthwise=False, act='silu')
```

Parameters

- **in_channels** (*int*) – input channels.
- **out_channels** (*int*) – output channels.
- **n** (*int*) – number of Bottlenecks. Default value: 1.

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.backbones.network_blocks.Focus(in_channels, out_channels, ksize=1, stride=1,
                                                    act='silu')
```

Bases: torch.nn.modules.module.Module

Focus width and height information into channel space.

```
__init__(in_channels, out_channels, ksize=1, stride=1, act='silu')
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.backbones.network_blocks.GSConv(c1, c2, k=1, s=1, g=1, act='silu')
```

Bases: torch.nn.modules.module.Module

GSConv is used to merge the channel information of DSConv and BaseConv You can refer to <https://github.com/AlanLi1997/slim-neck-by-gsconv> for more details

```
__init__(c1, c2, k=1, s=1, g=1, act='silu')
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

class `easycv.models.backbones.network_blocks.GSBottleneck(c1, c2, k=3, s=1)`

Bases: `torch.nn.modules.module.Module`

The use of GSBottleneck is to stack the GSConv layer You can refer to <https://github.com/AlanLi1997/slim-neck-by-gsconv> for more details

__init__(c1, c2, k=3, s=1)

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

class `easycv.models.backbones.network_blocks.VoVGSCSP(c1, c2, n=1, shortcut=True, g=1, e=0.5)`

Bases: `torch.nn.modules.module.Module`

VoVGSCSP is a new neck structure used in CSPNet You can refer to <https://github.com/AlanLi1997/slim-neck-by-gsconv> for more details

__init__(c1, c2, n=1, shortcut=True, g=1, e=0.5)

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

easycv.models.backbones.pytorch_image_models_wrapper module

```
class easycv.models.backbones.pytorch_image_models_wrapper.PytorchImageModelWrapper(model_name='resnet50',
                                                                                       scriptable=None,
                                                                                       ex-
                                                                                       portable=None,
                                                                                       no_jit=None,
                                                                                       **kwargs)
```

Bases: torch.nn.modules.module.Module

Support Backbones From pytorch-image-models. The PyTorch community has lots of awesome contributions for image models. PyTorch Image Models (timm) is a collection of image models, aim to pull together a wide variety of SOTA models with ability to reproduce ImageNet training results. Model pages can be found at <https://rwightman.github.io/pytorch-image-models/models/> References: <https://github.com/rwightman/pytorch-image-models>

__init__(model_name='resnet50', scriptable=None, exportable=None, no_jit=None, **kwargs)

Initiates PytorchImageModelWrapper by timm.create_models :param model_name: name of model to instantiate :type model_name: str :param scriptable: set layer config so that model is jit scriptable (not working for all models yet) :type scriptable: bool :param exportable: set layer config so that model is traceable / ONNX exportable (not fully impl/obeyed yet) :type exportable: bool :param no_jit: set layer config so that model doesn't utilize jit scripted layers (so far activations only) :type no_jit: bool

init_weights(pretrained=None)

Parameters

- **pretrained == True** (if) –
- **model from default path;** (load) –
- **pretrained == False or None** (if) –
- **from init weights.** (load) –
- **model_name in timm_model_names** (if) –
- **model from timm default path;** (load) –
- **model_name in _MODEL_MAP** (if) –
- **model from easycv default path** (load) –

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

easycv.models.backbones.resnest module

ResNet variants

```
class easycv.models.backbones.resnest.SplitAtConv2d(in_channels, channels, kernel_size, stride=(1, 1),
                                                    padding=(0, 0), dilation=(1, 1), groups=1,
                                                    bias=True, radix=2, reduction_factor=4,

```

Bases: torch.nn.modules.module.Module

ResNet Variants

Parameters

- **block** ([Block](#)) – Class for the residual block. Options are BasicBlockV1, BottleneckV1.
- **layers** (*list of int*) – Numbers of layers in each block

- **classes** (*int*, *default 1000*) – Number of classification classes.
- **dilated** (*bool*, *default False*) – Applying dilation strategy to pretrained ResNet yielding a stride-8 model, typically used in Semantic Segmentation.
- **norm_layer** (*object*) – Normalization layer used in backbone network (default: `mxnet.gluon.nn.BatchNorm`; for Synchronized Cross-GPU BatchNormalization).
- **Reference** –

                                              False, False, False), with_cp=False, frelu=False,
                                              original_inplanes=64, stem_channels=64,
                                              zero_init_residual=False, multi_grid=None,
                                              contract_dilation=False)
```

Bases: `torch.nn.modules.module.Module`

ResNet backbone.

Parameters

- **depth** (*int*) – Depth of resnet, from {18, 34, 50, 101, 152}.
- **in_channels** (*int*) – Number of input image channels. Normally 3.
- **num_stages** (*int*) – Resnet stages, normally 4.
- **strides** (*Sequence[int]*) – Strides of the first block of each stage.
- **dilations** (*Sequence[int]*) – Dilation of each stage.
- **out_indices** (*Sequence[int]*) – Output from which stages.
- **style** (*str*) – *pytorch* or *caffe*. If set to “pytorch”, the stride-two layer is the 3x3 conv layer, otherwise the stride-two layer is the first 1x1 conv layer.
- **deep_stem** (*bool*) – Replace 7x7 conv in input stem with 3 3x3 conv. Default: False.
- **avg_down** (*bool*) – Use AvgPool instead of stride conv when downsampling in the bottleneck. Default: False.
- **frozen_stages** (*int*) – Stages to be frozen (stop grad and set eval mode). -1 means not freezing any parameters.
- **norm_cfg** (*dict*) – dictionary to construct and config norm layer.
- **norm_eval** (*bool*) – Whether to set norm layers to eval mode, namely, freeze running stats (mean and var). Note: Effect on Batch Norm and its variants only.
- **with_cp** (*bool*) – Use checkpoint or not. Using checkpoint will save some memory while slowing down the training speed.
- **original_inplanes** – start channel for first block, default=64
- **stem_channels** (*int*) – Number of stem channels. Default: 64.
- **zero_init_residual** (*bool*) – whether to use zero init for last norm layer in resblocks to let them behave as identity.
- **multi_grid** (*Sequence[int]/None*) – Multi grid dilation rates of last stage. Default: None.
- **contract_dilation** (*bool*) – Whether contract first dilation of each layer Default: False.

Example

```
>>> from easycv.models import ResNet
>>> import torch
>>> self = ResNet(depth=18)
>>> self.eval()
>>> inputs = torch.rand(1, 3, 32, 32)
>>> level_outputs = self.forward(inputs)
>>> for level_out in level_outputs:
...     print(tuple(level_out.shape))
(1, 64, 8, 8)
(1, 128, 4, 4)
(1, 256, 2, 2)
(1, 512, 1, 1)
```

```

arch_settings = {10: (<class 'easycv.models.backbones.resnet.BasicBlock'>, (1, 1, 1, 1)), 18: (<class 'easycv.models.backbones.resnet.BasicBlock'>, (2, 2, 2, 2)), 34: (<class 'easycv.models.backbones.resnet.BasicBlock'>, (3, 4, 6, 3)), 50: (<class 'easycv.models.backbones.resnet.Bottleneck'>, (3, 4, 6, 3)), 101: (<class 'easycv.models.backbones.resnet.Bottleneck'>, (3, 4, 23, 3)), 152: (<class 'easycv.models.backbones.resnet.Bottleneck'>, (3, 8, 36, 3))}

__init__(depth, in_channels=3, num_stages=4, strides=(1, 2, 2, 2), dilations=(1, 1, 1, 1), out_indices=(0, 1, 2, 3, 4), style='pytorch', deep_stem=False, avg_down=False, num_classes=0, frozen_stages=-1, conv_cfg=None, norm_cfg={'requires_grad': True, 'type': 'BN'}, norm_eval=False, dcn=None, stage_with_dcn=(False, False, False, False), with_cp=False, frelu=False, original_inplanes=64, stem_channels=64, zero_init_residual=False, multi_grid=None, contract_dilation=False)
Initializes internal Module state, shared by both nn.Module and ScriptModule.

```

property norm1

init_weights()

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

train(mode=True)

Sets the module in training mode.

This has any effect only on certain modules. See documentations of particular modules for details of their behaviors in training/evaluation mode, if they are affected, e.g. Dropout, BatchNorm, etc.

Parameters *mode* (*bool*) – whether to set training mode (True) or evaluation mode (False).

Default: True.

Returns self

Return type Module

training: bool

class easycv.models.backbones.resnet.**ResNetV1c**(**kwargs)

Bases: [easycv.models.backbones.resnet.ResNet](#)

Compared to ResNet, ResNetV1c replaces the 7x7 conv in the input stem with three 3x3 convs. For more details please refer to <https://arxiv.org/abs/1812.01187>.

training: bool

__init__(**kwargs)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

class easycv.models.backbones.resnet.**ResNetV1d**(**kwargs)

Bases: [easycv.models.backbones.resnet.ResNet](#)

Compared to ResNet, ResNetV1d replaces the 7x7 conv in the input stem with three 3x3 convs. And in the downsampling block, a 2x2 avg_pool with stride 2 is added before conv, whose stride is changed to 1.

training: bool

__init__(**kwargs)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

easycv.models.backbones.resnet_jit module

class easycv.models.backbones.resnet_jit.**BasicBlock**(inplanes, planes, stride=1, dilation=1, downsample=None, style='pytorch', with_cp=False, conv_cfg=None, norm_cfg={'type': 'BN'})

'type': 'BN'}, norm_eval=False, with_cp=False, zero_init_residual=False)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

property norm1

init_weights()

training: bool

forward(*x*: torch.Tensor) → List[torch.Tensor]

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

train(*mode=True*)

Sets the module in training mode.

This has any effect only on certain modules. See documentations of particular modules for details of their behaviors in training/evaluation mode, if they are affected, e.g. Dropout, BatchNorm, etc.

Parameters *mode* (bool) – whether to set training mode (True) or evaluation mode (False).
Default: True.

Returns self

Return type Module

easycv.models.backbones.resnext module

class easycv.models.backbones.resnext.Bottleneck(*inplanes, planes, groups=1, base_width=4, **kwargs*)

Bases: [easycv.models.backbones.resnet.Bottleneck](#)

__init__(*inplanes, planes, groups=1, base_width=4, **kwargs*)

Bottleneck block for ResNeXt. If style is “pytorch”, the stride-two layer is the 3x3 conv layer, if it is “caffe”, the stride-two layer is the first 1x1 conv layer.

training: bool

```
easycv.models.backbones.resnext.make_res_layer(block, inplanes, planes, blocks, stride=1, dilation=1,
                                                  groups=1, base_width=4, style='pytorch',
                                                  with_cp=False, conv_cfg=None, norm_cfg={'type':
                                                  'BN'})
```

```
class easycv.models.backbones.resnext.ResNeXt(groups=1, base_width=4, **kwargs)
```

Bases: [easycv.models.backbones.resnet.ResNet](#)

ResNeXt backbone.

Parameters

- **depth** (*int*) – Depth of resnet, from {18, 34, 50, 101, 152}.
- **in_channels** (*int*) – Number of input image channels. Normally 3.
- **num_stages** (*int*) – Resnet stages, normally 4.
- **groups** (*int*) – Group of resnext.
- **base_width** (*int*) – Base width of resnext.
- **strides** (*Sequence[int]*) – Strides of the first block of each stage.
- **dilations** (*Sequence[int]*) – Dilation of each stage.
- **out_indices** (*Sequence[int]*) – Output from which stages.
- **style** (*str*) – *pytorch* or *caffe*. If set to “pytorch”, the stride-two layer is the 3x3 conv layer, otherwise the stride-two layer is the first 1x1 conv layer.
- **frozen_stages** (*int*) – Stages to be frozen (all param fixed). -1 means not freezing any parameters.
- **norm_cfg** (*dict*) – dictionary to construct and config norm layer.
- **norm_eval** (*bool*) – Whether to set norm layers to eval mode, namely, freeze running stats (mean and var). Note: Effect on Batch Norm and its variants only.
- **with_cp** (*bool*) – Use checkpoint or not. Using checkpoint will save some memory while slowing down the training speed.
- **zero_init_residual** (*bool*) – whether to use zero init for last norm layer in resblocks to let them behave as identity.

Example

```
>>> from easycv.models import ResNeXt
>>> import torch
>>> self = ResNeXt(depth=50)
>>> self.eval()
>>> inputs = torch.rand(1, 3, 32, 32)
>>> level_outputs = self.forward(inputs)
>>> for level_out in level_outputs:
...     print(tuple(level_out.shape))
(1, 256, 8, 8)
(1, 512, 4, 4)
(1, 1024, 2, 2)
(1, 2048, 1, 1)
```

```
arch_settings = {50: (<class 'easycv.models.backbones.resnext.Bottleneck'>, (3, 4, 6, 3)), 101: (<class 'easycv.models.backbones.resnext.Bottleneck'>, (3, 4, 23, 3)), 152: (<class 'easycv.models.backbones.resnext.Bottleneck'>, (3, 8, 36, 3))}
```

```
__init__(groups=1, base_width=4, **kwargs)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
training: bool
```

easycv.models.backbones.shuffle_transformer module

```
class easycv.models.backbones.shuffle_transformer.Mlp(in_features, hidden_features=None, out_features=None, act_layer=<class 'torch.nn.modules.activation.ReLU6'>, drop=0.0, stride=False)
```

Bases: torch.nn.modules.module.Module

```
__init__(in_features, hidden_features=None, out_features=None, act_layer=<class 'torch.nn.modules.activation.ReLU6'>, drop=0.0, stride=False)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
forward(x)
```

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

```

easycv.models.backbones.swin_transformer_dynamic module

Borrow this code from https://github.com/microsoft/esvit/blob/main/models/swin_transformer.py To support dynamic swin-transformer for ssl!

```
class easycv.models.backbones.swin_transformer_dynamic.WindowAttention(dim, window_size,
                                                                    num_heads,
                                                                    qkv_bias=True,
                                                                    qk_scale=None,
                                                                    attn_drop=0.0,
                                                                    proj_drop=0.0)
```

Bases: torch.nn.modules.module.Module

Window based multi-head self attention (W-MSA) module with relative position bias. It supports both of shifted and non-shifted window.

Parameters

- **dim** (*int*) – Number of input channels.
- **window_size** (*tuple[int]*) – The height and width of the window.
- **num_heads** (*int*) – Number of attention heads.
- **qkv_bias** (*bool*, *optional*) – If True, add a learnable bias to query, key, value. Default: True
- **qk_scale** (*float | None*, *optional*) – Override default qk scale of head_dim ** -0.5 if set
- **attn_drop** (*float*, *optional*) – Dropout ratio of attention weight. Default: 0.0
- **proj_drop** (*float*, *optional*) – Dropout ratio of output. Default: 0.0

```
__init__(dim, window_size, num_heads, qkv_bias=True, qk_scale=None, attn_drop=0.0, proj_drop=0.0)
    Initializes internal Module state, shared by both nn.Module and ScriptModule.
```

```
forward(x, mask=None)
```

Parameters

- **x** – input features with shape of (num_windows*B, N, C)
- **mask** – (0/-inf) mask with shape of (num_windows, Wh*Ww, Wh*Ww) or None

```
extra_repr() → str

                                                                           num_heads,
                                                                           window_size=7,
                                                                           shift_size=0,
                                                                           mlp_ratio=4.0,
                                                                           qkv_bias=True,
                                                                           qk_scale=None,
                                                                           drop=0.0,
                                                                           attn_drop=0.0,
                                                                           drop_path=0.0,
                                                                           act_layer=<class
                                                                           'torch.nn.modules.activation.GELU'>,
                                                                           norm_layer=<class
                                                                           'torch.nn.modules.normalization.La
```

Bases: `torch.nn.modules.module.Module`

Swin Transformer Block.

Parameters

- **dim** (*int*) – Number of input channels.
- **input_resolution** (*tuple[int]*) – Input resolution.
- **num_heads** (*int*) – Number of attention heads.
- **window_size** (*int*) – Window size.
- **shift_size** (*int*) – Shift size for SW-MSA.
- **mlp_ratio** (*float*) – Ratio of mlp hidden dim to embedding dim.
- **qkv_bias** (*bool*, *optional*) – If True, add a learnable bias to query, key, value. Default: True
- **qk_scale** (*float* | *None*, *optional*) – Override default qk scale of head_dim ** -0.5 if set.
- **drop** (*float*, *optional*) – Dropout rate. Default: 0.0
- **attn_drop** (*float*, *optional*) – Attention dropout rate. Default: 0.0
- **drop_path** (*float*, *optional*) – Stochastic depth rate. Default: 0.0
- **act_layer** (*nn.Module*, *optional*) – Activation layer. Default: nn.GELU
- **norm_layer** (*nn.Module*, *optional*) – Normalization layer. Default: nn.LayerNorm

```
__init__(dim, input_resolution, num_heads, window_size=7, shift_size=0, mlp_ratio=4.0, qkv_bias=True,
         qk_scale=None, drop=0.0, attn_drop=0.0, drop_path=0.0, act_layer=<class
         'torch.nn.modules.activation.GELU'>, norm_layer=<class
         'torch.nn.modules.normalization.LayerNorm'>)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
create_attn_mask(H, W)
```

```
forward(x)
```

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

extra_repr() → str

Set the extra representation of the module

To print customized extra information, you should re-implement this method in your own modules. Both single-line and multi-line strings are acceptable.

flops()

training: bool

```
class easycv.models.backbones.swin_transformer_dynamic.PatchMerging(input_resolution, dim,
                                                                    norm_layer=<class
                                                                    'torch.nn.modules.normalization.LayerNorm'>)
```

Bases: torch.nn.modules.module.Module

Patch Merging Layer.

Parameters

- **input_resolution** (*tuple[int]*) – Resolution of input feature.
- **dim** (*int*) – Number of input channels.
- **norm_layer** (*nn.Module, optional*) – Normalization layer. Default: nn.LayerNorm

__init__ (*input_resolution, dim, norm_layer=<class 'torch.nn.modules.normalization.LayerNorm'>*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward (*x*)

Forward function. :param x: Input feature, tensor size (B, H*W, C). :param H: Spatial resolution of the input feature. :param W: Spatial resolution of the input feature.

extra_repr() → str

Set the extra representation of the module

To print customized extra information, you should re-implement this method in your own modules. Both single-line and multi-line strings are acceptable.

flops()

training: bool

```
class easycv.models.backbones.swin_transformer_dynamic.BasicLayer(dim, input_resolution, depth,
                                                                    num_heads, window_size,
                                                                    mlp_ratio=4.0,
                                                                    qkv_bias=True,
                                                                    qk_scale=None, drop=0.0,
                                                                    attn_drop=0.0,
                                                                    drop_path=0.0,
                                                                    norm_layer=<class
                                                                    'torch.nn.modules.normalization.LayerNorm'>,
                                                                    downsampler=None)
```

Bases: torch.nn.modules.module.Module

A basic Swin Transformer layer for one stage.

Parameters

- **dim** (*int*) – Number of input channels.
- **input_resolution** (*tuple[int]*) – Input resolution.
- **depth** (*int*) – Number of blocks.
- **num_heads** (*int*) – Number of attention heads.
- **window_size** (*int*) – Window size.
- **mlp_ratio** (*float*) – Ratio of mlp hidden dim to embedding dim.
- **qkv_bias** (*bool, optional*) – If True, add a learnable bias to query, key, value. Default: True
- **qk_scale** (*float | None, optional*) – Override default qk scale of head_dim ** -0.5 if set.
- **drop** (*float, optional*) – Dropout rate. Default: 0.0
- **attn_drop** (*float, optional*) – Attention dropout rate. Default: 0.0
- **drop_path** (*float | tuple[float], optional*) – Stochastic depth rate. Default: 0.0
- **norm_layer** (*nn.Module, optional*) – Normalization layer. Default: nn.LayerNorm
- **downsample** (*nn.Module | None, optional*) – Downsample layer at the end of the layer. Default: None

__init__ (*dim, input_resolution, depth, num_heads, window_size, mlp_ratio=4.0, qkv_bias=True, qk_scale=None, drop=0.0, attn_drop=0.0, drop_path=0.0, norm_layer=<class 'torch.nn.modules.normalization.LayerNorm'>, downsample=None*)
 Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward (*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

forward_with_features (*x*)

forward_with_attention (*x*)

extra_repr () → str

Set the extra representation of the module

To print customized extra information, you should re-implement this method in your own modules. Both single-line and multi-line strings are acceptable.

```

Bases: torch.nn.modules.module.Module

Swin Transformer

A PyTorch impl of [*Swin Transformer: Hierarchical Vision Transformer using Shifted Windows -*] <https://arxiv.org/pdf/2103.14030>

Parameters

- **img_size** (*int* | *tuple(int)*) – Input image size.
- **patch_size** (*int* | *tuple(int)*) – Patch size.
- **in_chans** (*int*) – Number of input channels.
- **num_classes** (*int*) – Number of classes for classification head.
- **embed_dim** (*int*) – Embedding dimension.

- **depths** (*tuple(int)*) – Depth of Swin Transformer layers.
- **num_heads** (*tuple(int)*) – Number of attention heads in different layers.
- **window_size** (*int*) – Window size.
- **mlp_ratio** (*float*) – Ratio of mlp hidden dim to embedding dim.
- **qkv_bias** (*bool*) – If True, add a learnable bias to query, key, value. Default: True
- **qk_scale** (*float*) – Override default qk scale of head_dim ** -0.5 if set.
- **drop_rate** (*float*) – Dropout rate.
- **attn_drop_rate** (*float*) – Attention dropout rate.
- **drop_path_rate** (*float*) – Stochastic depth rate.
- **norm_layer** (*nn.Module*) – normalization layer.
- **ape** (*bool*) – If True, add absolute position embedding to the patch embedding.
- **patch_norm** (*bool*) – If True, add normalization after patch embedding.

```
__init__(img_size=224, patch_size=4, in_chans=3, num_classes=1000, embed_dim=96, depths=[2, 2, 6,
2], num_heads=[3, 6, 12, 24], window_size=7, mlp_ratio=4.0, qkv_bias=True, qk_scale=None,
drop_rate=0.0, attn_drop_rate=0.0, drop_path_rate=0.1, norm_layer=<class
'torch.nn.modules.normalization.LayerNorm'>, ape=False, patch_norm=True,
use_dense_prediction=False, **kwargs)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights()

no_weight_decay()

no_weight_decay_keywords()

forward_features(x)

forward_feature_maps(x)

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

easycv.models.backbones.xcit_transformer module

Implementation of Cross-Covariance Image Transformer (XCiT) Based on timm and DeiT code bases <https://github.com/rwightman/pytorch-image-models/tree/master/timm> <https://github.com/facebookresearch/deit/>

XCiT Transformer. Part of the code is borrowed from: <https://github.com/facebookresearch/xcit/blob/master/xcit.py>

```

class easycv.models.backbones.xcit_transformer.PositionalEncodingFourier(hidden_dim=32,
                                                                    dim=768,
                                                                    temperature=10000)

```

Bases: torch.nn.modules.module.Module

Positional encoding relying on a fourier kernel matching the one used in the “Attention is all of Need” paper. The implementation builds on DeTR code https://github.com/facebookresearch/detr/blob/master/models/position_encoding.py

```
__init__(hidden_dim=32, dim=768, temperature=10000)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
forward(B, H, W)
```

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```

easycv.models.backbones.xcit_transformer.conv3x3(in_planes, out_planes, stride=1)
3x3 convolution with padding

```

```

class easycv.models.backbones.xcit_transformer.ConvPatchEmbed(img_size=224, patch_size=16,
                                                                in_chans=3, embed_dim=768)

```

Bases: torch.nn.modules.module.Module

Image to Patch Embedding using multiple convolutional layers

```
__init__(img_size=224, patch_size=16, in_chans=3, embed_dim=768)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
forward(x, padding_size=None)
```

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.backbones.xcit_transformer.LPI(in_features, hidden_features=None,
                                                    out_features=None, act_layer=<class
                                                    'torch.nn.modules.activation.GELU'>, drop=0.0,
                                                    kernel_size=3)
```

Bases: torch.nn.modules.module.Module

Local Patch Interaction module that allows explicit communication between tokens in 3x3 windows to augment the implicit communication performed by the block diagonal scatter attention. Implemented using 2 layers of separable 3x3 convolutions with GeLU and BatchNorm2d

```
__init__(in_features, hidden_features=None, out_features=None, act_layer=<class
        'torch.nn.modules.activation.GELU'>, drop=0.0, kernel_size=3)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*, *H*, *W*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.backbones.xcit_transformer.ClassAttention(dim, num_heads=8,
                                                             qkv_bias=False, qk_scale=None,
                                                             attn_drop=0.0, proj_drop=0.0)
```

Bases: torch.nn.modules.module.Module

Class Attention Layer as in CaiT <https://arxiv.org/abs/2103.17239>

```
__init__(dim, num_heads=8, qkv_bias=False, qk_scale=None, attn_drop=0.0, proj_drop=0.0)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.backbones.xcit_transformer.ClassAttentionBlock(dim, num_heads,
                                                                mlp_ratio=4.0,
                                                                qkv_bias=False,
                                                                qk_scale=None, drop=0.0,
                                                                attn_drop=0.0,
                                                                drop_path=0.0,
                                                                act_layer=<class
                                                                'torch.nn.modules.activation.GELU'>,
                                                                norm_layer=<class
                                                                'torch.nn.modules.normalization.LayerNorm'>,
                                                                eta=None,
                                                                tokens_norm=False)
```

Bases: `torch.nn.modules.module.Module`

Class Attention Layer as in CaiT <https://arxiv.org/abs/2103.17239>

```
__init__(dim, num_heads, mlp_ratio=4.0, qkv_bias=False, qk_scale=None, drop=0.0, attn_drop=0.0,
         drop_path=0.0, act_layer=<class 'torch.nn.modules.activation.GELU'>, norm_layer=<class
         'torch.nn.modules.normalization.LayerNorm'>, eta=None, tokens_norm=False)
```

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

forward(*x*, *H*, *W*, *mask=None*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

```
class easycv.models.backbones.xcit_transformer.XCA(dim, num_heads=8, qkv_bias=False,
                                                  qk_scale=None, attn_drop=0.0, proj_drop=0.0)
```

Bases: `torch.nn.modules.module.Module`

Cross-Covariance Attention (XCA) operation where the channels are updated using a weighted sum.

The weights are obtained from the (softmax normalized) Cross-covariance matrix ($Q^T K$ in d_h times d_h)

```
__init__(dim, num_heads=8, qkv_bias=False, qk_scale=None, attn_drop=0.0, proj_drop=0.0)
```

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

no_weight_decay()

training: `bool`

```
class easycv.models.backbones.xcit_transformer.XCABlock(dim, num_heads, mlp_ratio=4.0,
                                                       qkv_bias=False, qk_scale=None,
                                                       drop=0.0, attn_drop=0.0, drop_path=0.0,
                                                       act_layer=<class
                                                       'torch.nn.modules.activation.GELU'>,
                                                       norm_layer=<class
                                                       'torch.nn.modules.normalization.LayerNorm'>,
                                                       num_tokens=196, eta=None)
```

Bases: torch.nn.modules.module.Module

```
__init__(dim, num_heads, mlp_ratio=4.0, qkv_bias=False, qk_scale=None, drop=0.0, attn_drop=0.0,
         drop_path=0.0, act_layer=<class 'torch.nn.modules.activation.GELU'>, norm_layer=<class
         'torch.nn.modules.normalization.LayerNorm'>, num_tokens=196, eta=None)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*, *H*, *W*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.backbones.xcit_transformer.XCiT(img_size=224, patch_size=16, in_chans=3,
                                                    num_classes=1000, embed_dim=768, depth=12,
                                                    num_heads=12, mlp_ratio=4.0, qkv_bias=True,
                                                    qk_scale=None, drop_rate=0.0,
                                                    attn_drop_rate=0.0, drop_path_rate=0.0,

                                                    use_pos=True, patch_proj='linear', eta=None,
                                                    tokens_norm=False)
```

Bases: torch.nn.modules.module.Module

Based on timm and DeiT code bases <https://github.com/rwightman/pytorch-image-models/tree/master/timm>
<https://github.com/facebookresearch/deit/>

```
__init__(img_size=224, patch_size=16, in_chans=3, num_classes=1000, embed_dim=768, depth=12,
         num_heads=12, mlp_ratio=4.0, qkv_bias=True, qk_scale=None, drop_rate=0.0,
         attn_drop_rate=0.0, drop_path_rate=0.0, norm_layer=None, cls_attn_layers=2, use_pos=True,
         patch_proj='linear', eta=None, tokens_norm=False)
```

Parameters

- **img_size** (*int*, *tuple*) – input image size
- **patch_size** (*int*, *tuple*) – patch size
- **in_chans** (*int*) – number of input channels
- **num_classes** (*int*) – number of classes for classification head
- **embed_dim** (*int*) – embedding dimension
- **depth** (*int*) – depth of transformer
- **num_heads** (*int*) – number of attention heads

- **mlp_ratio** (*int*) – ratio of mlp hidden dim to embedding dim
- **qkv_bias** (*bool*) – enable bias for qkv if True
- **qk_scale** (*float*) – override default qk scale of head_dim ** -0.5 if set
- **drop_rate** (*float*) – dropout rate
- **attn_drop_rate** (*float*) – attention dropout rate
- **drop_path_rate** (*float*) – stochastic depth rate
- **norm_layer** – (nn.Module): normalization layer
- **cls_attn_layers** – (int) Depth of Class attention layers
- **use_pos** – (bool) whether to use positional encoding
- **eta** – (float) layerscale initialization value
- **tokens_norm** – (bool) Whether to normalize all tokens or just the cls_token in the CA

init_weights()

no_weight_decay()

forward_features(x)

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```

26.1.2 easycv.models.classification package

Submodules

easycv.models.classification.classification module

```
class easycv.models.classification.classification.Classification(backbone, train_preprocess=[],  
                                                                with_sobel=False, head=None,  
                                                                neck=None, pretrained=True,  
                                                                mixup_cfg=None)
```

Bases: [easycv.models.base.BaseModel](#)

Parameters

- **pretrained** – Select one {str or True or False/None}.
- **pretrained == str (if) –**
- **model from specified path; (load) –**
- **pretrained == True (if) –**
- **model from default path (load) –**
- **pretrained == False or None (if) –**
- **from init weights. (load) –**

```
__init__(backbone, train_preprocess=[], with_sobel=False, head=None, neck=None, pretrained=True,  
         mixup_cfg=None)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights()

forward_backbone(img: torch.Tensor) → List[torch.Tensor]

Forward backbone

Returns backbone outputs

Return type x (tuple)

forward_train(img, gt_labels) → Dict[str, torch.Tensor]

In forward train, model will forward backbone + neck / multi-neck, get alist of output tensor, and put this list to head / multi-head, to compute each loss

forward_test(img: torch.Tensor) → Dict[str, torch.Tensor]

forward_test means generate prob/class from image only support one neck + one head

forward_test_label(img, gt_labels) → Dict[str, torch.Tensor]

forward_test_label means generate prob/class from image only support one neck + one head ps : head init need set the input feature idx

training: bool

aug_test(imgs)

forward_feature(img) → Dict[str, torch.Tensor]

Forward feature means forward backbone + neck/multineck ,get dict of output feature,

self.neck_num = 0: means only forward backbone, output backbone feature with avgpool,
with key neck, self.neck_num > 0: means has 1/multi neck, output neck's feature with key
neck_neckidx_featureidx, suck as neck_0_0

Returns feature tensor

Return type x (torch.Tensor)

update_extract_list(key)

forward(img: torch.Tensor, mode: str = 'train', gt_labels: Optional[torch.Tensor] = None, img metas: Optional[torch.Tensor] = None) → Dict[str, torch.Tensor]

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

easycv.models.classification.necks module

class easycv.models.classification.necks.**LinearNeck**(in_channels, out_channels, with_avg_pool=True, with_norm=False)

Bases: torch.nn.modules.module.Module

Linear neck: fc only

__init__(in_channels, out_channels, with_avg_pool=True, with_norm=False)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights(init_linear='normal')

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.classification.necks.**RetrivalNeck**(in_channels, out_channels, with_avg_pool=True, cdg_config=['G', 'M'])

Bases: torch.nn.modules.module.Module

RetrivalNeck: refer, Combination of Multiple Global Descriptors for Image Retrieval <https://arxiv.org/pdf/1903.10663.pdf>

CGD feature : only use avg pool + gem pooling + max pooling, by pool -> fc -> norm -> concat -> norm Avg feature : use avg pooling, avg pool -> syncbn -> fc

len(cgd_config) > 0: return [CGD, Avg] len(cgd_config) = 0 : return [Avg]

__init__(in_channels, out_channels, with_avg_pool=True, cdg_config=['G', 'M'])

Init RetrivalNeck, faceid neck doesn't pool for input feature map, doesn't support dynamic input

Parameters

- **in_channels** – Int - input feature map channels

- **out_channels** – Int - output feature map channels
- **with_avg_pool** – bool do avg pool for BNneck or not
- **cdg_config** – list('G','M','S'), to configure output feature, CGD = [gempooling] + [maxpooling] + [meanpooling], if len(cgd_config) > 0: return [CGD, Avg] if len(cgd_config) = 0 : return [Avg]

init_weights(*init_linear='normal'*)

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.classification.necks.**FaceIDNeck**(*in_channels, out_channels, map_shape=1, dropout_ratio=0.4, with_norm=False, bn_type='SyncBN'*)

Bases: torch.nn.modules.module.Module

FaceID neck: Include BN, dropout, flatten, linear, bn

__init__(*in_channels, out_channels, map_shape=1, dropout_ratio=0.4, with_norm=False, bn_type='SyncBN'*)

Init FaceIDNeck, faceid neck doesn't pool for input feature map, doesn't support dynamic input

Parameters

- **in_channels** – Int - input feature map channels
- **out_channels** – Int - output feature map channels
- **map_shape** – Int or list(int,...), input feature map (w,h) or w when w=h,
- **dropout_ratio** – float, drop out ratio
- **with_norm** – normalize output feature or not
- **bn_type** – SyncBN or BN

init_weights(*init_linear='normal'*)

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.classification.necks.MultiLinearNeck(in_channels, out_channels,  
                                                    num_layers=1, with_avg_pool=True)
```

Bases: torch.nn.modules.module.Module

MultiLinearNeck neck: MultiFc head

```
__init__(in_channels, out_channels, num_layers=1, with_avg_pool=True)
```

Parameters

- **in_channels** – int or list[int]
- **out_channels** – int or list[int]
- **num_layers** – total fc num
- **with_avg_pool** – input will be avgPool if True

Returns None

Raises

- **len(in_channel) != len(out_channels)** –
- **len(in_channel) != len(num_layers)** –

```
init_weights(init_linear='normal')
```

```
forward(x)
```

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.classification.necks.HRFuseScales(in_channels, out_channels=2048,  
                                                    norm_cfg={'momentum': 0.1, 'type': 'BN'})
```

Bases: torch.nn.modules.module.Module

Fuse feature map of multiple scales in HRNet. :param in_channels: The input channels of all scales. :type in_channels: list[int] :param out_channels: The channels of fused feature map.

Defaults to 2048.

Parameters

- **norm_cfg** (*dict*) – dictionary to construct norm layers. Defaults to dict(type='BN', momentum=0.1).
- **init_cfg** (*dict | list[dict], optional*) – Initialization config dict. Defaults to dict(type='Normal', layer='Linear', std=0.01).

```
__init__(in_channels, out_channels=2048, norm_cfg={'momentum': 0.1, 'type': 'BN'})
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
init_weights(init_linear='normal')
```

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.classification.necks.**ReIDNeck**(*in_channels, dropout, relu=False, norm=True, out_channels=512*)

Bases: torch.nn.modules.module.Module

ReID neck: Include Linear, bn, relu, dropout

__init__(*in_channels, dropout, relu=False, norm=True, out_channels=512*)

Init FaceIDNeck, faceid neck doesn't pool for input feature map, doesn't support dynamic input

Parameters

- **in_channels** – Int - input feature map channels
- **out_channels** – Int - output feature map channels
- **map_shape** – Int or list(int,...), input feature map (w,h) or w when w=h,
- **dropout_ratio** – float, drop out ratio
- **with_norm** – normalize output feature or not
- **bn_type** – SyncBN or BN

training: bool

init_weights(*init_linear='kaiming'*)

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

26.1.3 easycv.models.detection package

Subpackages

easycv.models.detection.utils package

Submodules

easycv.models.detection.utils.bboxes module

`easycv.models.detection.utils.bboxes.bboxes_iou(bboxes_a, bboxes_b, xyxy=True)`

`easycv.models.detection.utils.bboxes.bbox2result(bboxes, labels, num_classes)`

Convert detection results to a list of numpy arrays. :param bboxes: shape (n, 5) :type bboxes: torch.Tensor | np.ndarray :param labels: shape (n,) :type labels: torch.Tensor | np.ndarray :param num_classes: class number, including background class :type num_classes: int

Returns bbox results of each class

Return type list(ndarray)

`easycv.models.detection.utils.bboxes.box_cxxywh_to_xyxy(x)`

`easycv.models.detection.utils.bboxes.box_xyxy_to_cxxywh(x)`

`easycv.models.detection.utils.bboxes.box_iou(boxes1, boxes2)`

`easycv.models.detection.utils.bboxes.generalized_box_iou(boxes1, boxes2)`

Generalized IoU from <https://giou.stanford.edu/> The boxes should be in [x0, y0, x1, y1] format Returns a [N, M] pairwise matrix, where N = len(boxes1) and M = len(boxes2)

`easycv.models.detection.utils.bboxes.bbox_overlaps(bboxes1, bboxes2, mode='iou', is_aligned=False, eps=1e-06)`

Calculate overlap between two set of bboxes.

FP16 Contributed by <https://github.com/open-mmlab/mmdetection/pull/4889> .. note:

Assume `bboxes1` is `M x 4`, `bboxes2` is `N x 4`, when mode is `'iou'`, there are some new generated variable when calculating IOU using `bbox_overlaps` function:

1) `is_aligned` is `False`

```
area1: M x 1
area2: N x 1
lt: M x N x 2
rb: M x N x 2
wh: M x N x 2
overlap: M x N x 1
union: M x N x 1
ious: M x N x 1
```

Total memory:

$$S = (9 \times N \times M + N + M) \times 4 \text{ Byte},$$

When using FP16, we can reduce:

$$R = (9 \times N \times M + N + M) \times 4 / 2 \text{ Byte}$$

R large than $(N + M) \times 4 \times 2$ is always true when N and M ≥ 1 .

Obviously, $N + M \leq N \times M < 3 \times N \times M$, when N ≥ 2 and M ≥ 2 ,

$$N + 1 < 3 \times N, \text{ when } N \text{ or } M \text{ is } 1.$$

Given M = 40 (ground truth), N = 400000 (three anchor boxes in per grid, FPN, R-CNNs),

R = 275 MB (one times)

A special case (dense detection), M = 512 (ground truth),

(continues on next page)

(continued from previous page)

$R = 3516 \text{ MB} = 3.43 \text{ GB}$

When the batch size is B , reduce:

$B \times R$

Therefore, CUDA memory runs out frequently.

Experiments on GeForce RTX 2080Ti (11019 MiB):

| | dtype | M | N | Use | Real | Ideal |
|--|-------|------|--------|----------|----------|----------|
| | : | ---- | : | ---- | : | ---- |
| | FP32 | 512 | 400000 | 8020 MiB | -- | -- |
| | FP16 | 512 | 400000 | 4504 MiB | 3516 MiB | 3516 MiB |
| | FP32 | 40 | 400000 | 1540 MiB | -- | -- |
| | FP16 | 40 | 400000 | 1264 MiB | 276MiB | 275 MiB |

2) `is_aligned` is `True`

area1: $N \times 1$

area2: $N \times 1$

lt: $N \times 2$

rb: $N \times 2$

wh: $N \times 2$

overlap: $N \times 1$

union: $N \times 1$

ious: $N \times 1$

Total memory:

$S = 11 \times N \times 4 \text{ Byte}$

When using FP16, we can reduce:

$R = 11 \times N \times 4 / 2 \text{ Byte}$

So do the 'giou' (large than 'iou').

Time-wise, FP16 is generally faster than FP32.

When `gpu_assign_thr` is `not -1`, it takes more time on cpu but `not` reduce memory.

There, we can reduce half the memory and keep the speed.

If `is_aligned` is `False`, then calculate the overlaps between each bbox of `bboxes1` and `bboxes2`, otherwise the overlaps between each aligned pair of `bboxes1` and `bboxes2`.

Parameters

- **bboxes1** (*Tensor*) – shape (B, m, 4) in <x1, y1, x2, y2> format or empty.
- **bboxes2** (*Tensor*) – shape (B, n, 4) in <x1, y1, x2, y2> format or empty. B indicates the batch dim, in shape (B1, B2, ..., Bn). If `is_aligned` is `True`, then m and n must be equal.
- **mode** (*str*) – “iou” (intersection over union), “iof” (intersection over foreground) or “giou” (generalized intersection over union). Default “iou”.
- **is_aligned** (*bool, optional*) – If `True`, then m and n must be equal. Default `False`.

- **eps** (*float, optional*) – A value added to the denominator for numerical stability. Default 1e-6.

Returns shape (m, n) if `is_aligned` is False else shape (m,)

Return type Tensor

Example

```
>>> bboxes1 = torch.FloatTensor([
>>>     [0, 0, 10, 10],
>>>     [10, 10, 20, 20],
>>>     [32, 32, 38, 42],
>>> ])
>>> bboxes2 = torch.FloatTensor([
>>>     [0, 0, 10, 20],
>>>     [0, 10, 10, 19],
>>>     [10, 10, 20, 20],
>>> ])
>>> overlaps = bbox_overlaps(bboxes1, bboxes2)
>>> assert overlaps.shape == (3, 3)
>>> overlaps = bbox_overlaps(bboxes1, bboxes2, is_aligned=True)
>>> assert overlaps.shape == (3, )
```

Example

```
>>> empty = torch.empty(0, 4)
>>> nonempty = torch.FloatTensor([[0, 0, 10, 9]])
>>> assert tuple(bbox_overlaps(empty, nonempty).shape) == (0, 1)
>>> assert tuple(bbox_overlaps(nonempty, empty).shape) == (1, 0)
>>> assert tuple(bbox_overlaps(empty, empty).shape) == (0, 0)
```

`easycv.models.detection.utils.bboxes.bbox2distance(points, bbox, max_dis=None, eps=0.1)`

Decode bounding box based on distances.

Parameters

- **points** (*Tensor*) – Shape (n, 2), [x, y].
- **bbox** (*Tensor*) – Shape (n, 4), “xyxy” format
- **max_dis** (*float*) – Upper bound of the distance.
- **eps** (*float*) – a small value to ensure target < max_dis, instead <=

Returns Decoded distances.

Return type Tensor

`easycv.models.detection.utils.bboxes.distance2bbox(points, distance, max_shape=None)`

Decode distance prediction to bounding box.

Parameters

- **points** (*Tensor*) – Shape (B, N, 2) or (N, 2).
- **distance** (*Tensor*) – Distance from the given point to 4 boundaries (left, top, right, bottom). Shape (B, N, 4) or (N, 4)

- **(Sequence[int] or torch.Tensor or Sequence[(max_shape) – Sequence[int]],optional):** Maximum bounds for boxes, specifies (H, W, C) or (H, W). If priors shape is (B, N, 4), then the max_shape should be a Sequence[Sequence[int]] and the length of max_shape should also be B.

Returns Boxes with shape (N, 4) or (B, N, 4)

Return type Tensor

`easycv.models.detection.utils.bboxes.batched_nms`(boxes, scores, idxs, nms_cfg, class_agnostic=False)

Performs non-maximum suppression in a batched fashion.

Modified from [torchvision/ops/bboxes.py#L39](https://pytorch.org/vision/main/generated/torchvision.ops.bboxes.py#L39). In order to perform NMS independently per class, we add an offset to all the boxes. The offset is dependent only on the class idx, and is large enough so that boxes from different classes do not overlap.

Note: In v1.4.1 and later, `batched_nms` supports skipping the NMS and returns sorted raw results when `nms_cfg` is None.

Parameters

- **boxes** (*torch.Tensor*) – boxes in shape (N, 4).
- **scores** (*torch.Tensor*) – scores in shape (N,).
- **idxs** (*torch.Tensor*) – each index value correspond to a bbox cluster, and NMS will not be applied between elements of different idxs, shape (N,).
- **nms_cfg** (*dict* / *None*) – Supports skipping the nms when `nms_cfg` is None, otherwise it should specify nms type and other parameters like `iou_thr`. Possible keys includes the following.
 - `iou_thr` (float): IoU threshold used for NMS.
 - `split_thr` (float): threshold number of boxes. In some cases the number of boxes is large (e.g., 200k). To avoid OOM during training, the users could set `split_thr` to a small value. If the number of boxes is greater than the threshold, it will perform NMS on each group of boxes separately and sequentially. Defaults to 10000.
- **class_agnostic** (*bool*) – if true, nms is class agnostic, i.e. IoU thresholding happens over all boxes, regardless of the predicted class.

Returns

kept dets and indice.

- **boxes** (Tensor): Bboxes with score after nms, has shape (num_bboxes, 5). last dimension 5 arrange as (x1, y1, x2, y2, score)
- **keep** (Tensor): The indices of remaining boxes in input boxes.

Return type tuple

easycv.models.detection.yolox package

Submodules

easycv.models.detection.yolox.yolo_head module

easycv.models.detection.yolox.yolox module

easycv.models.detection.yolox_edge package

Submodules

easycv.models.detection.yolox_edge.yolox_edge module

26.1.4 easycv.models.heads package

Submodules

easycv.models.heads.cls_head module

```
class easycv.models.heads.cls_head.ClsHead(with_avg_pool=False, label_smooth=0.0,
                                           in_channels=2048, with_fc=True, num_classes=1000,
                                           loss_config={'type': 'CrossEntropyLossWithLabelSmooth'},
                                           input_feature_index=[0], init_cfg={'bias': 0.0, 'layer':
                                           'Linear', 'std': 0.01, 'type': 'Normal'},
                                           use_num_classes=True)
```

Bases: torch.nn.modules.module.Module

Simplest classifier head, with only one fc layer. Should Notice Evtorch module design input always be feature_list = [tensor, tensor,...]

```
__init__(with_avg_pool=False, label_smooth=0.0, in_channels=2048, with_fc=True, num_classes=1000,
         loss_config={'type': 'CrossEntropyLossWithLabelSmooth'}, input_feature_index=[0],
         init_cfg={'bias': 0.0, 'layer': 'Linear', 'std': 0.01, 'type': 'Normal'}, use_num_classes=True)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights()

forward(x: List[torch.Tensor]) → List[torch.Tensor]

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

loss(cls_score: List[torch.Tensor], labels: torch.Tensor) → Dict[str, torch.Tensor]

Parameters

- **cls_score** – [N x num_classes]
- **labels** – if don't use mixup, shape is [N], else [N x num_classes]

mixup_loss(cls_score, labels_1, labels_2, lam) → Dict[str, torch.Tensor]

training: bool

easycv.models.heads.contrastive_head module

class easycv.models.heads.contrastive_head.**ContrastiveHead**(temperature=0.1)

Bases: torch.nn.modules.module.Module

Head for contrastive learning.

__init__(temperature=0.1)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(pos, neg)

Parameters

- **pos** (Tensor) – Nx1 positive similarity
- **neg** (Tensor) – Nxk negative similarity

training: bool

class easycv.models.heads.contrastive_head.**DebiasedContrastiveHead**(temperature=0.1, tau=0.1)

Bases: torch.nn.modules.module.Module

__init__(temperature=0.1, tau=0.1)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(pos, neg)

Parameters

- **pos** (Tensor) – Nx1 positive similarity
- **neg** (Tensor) – Nxk negative similarity

training: bool

easycv.models.heads.latent_pred_head module

class easycv.models.heads.latent_pred_head.**LatentPredictHead**(predictor, size_average=True)

Bases: torch.nn.modules.module.Module

Head for contrastive learning.

__init__(predictor, size_average=True)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights(init_linear='normal')

forward(input, target)

Parameters

- **input** (Tensor) – NxC input features.

- **target** (*Tensor*) – Nx C target features.

training: `bool`

class `easycv.models.heads.latent_pred_head.LatentClsHead(predictor)`

Bases: `torch.nn.modules.module.Module`

Head for contrastive learning.

__init__(*predictor*)

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

init_weights(*init_linear='normal'*)

forward(*input, target*)

Parameters

- **input** (*Tensor*) – Nx C input features.
- **target** (*Tensor*) – Nx C target features.

training: `bool`

`easycv.models.heads.mp_metric_head` module

`easycv.models.heads.mp_metric_head.EmbeddingExpansion(embs, labels, explanion_rate=4, alpha=1.0)`

Expand embedding: CVPR refer to <https://github.com/clovaai/embedding-expansion> combine PK sampled data, mixup anchor positive pair to generate more features, always combine with BatchHardminer. result on SOP and CUB need to be add

Parameters

- **embs** – [N , dims] tensor
- **labels** – [N] tensor
- **explanion_rate** – to expand N to explanion_rate * N
- **alpha** – beta distribution parameter for mixup

Returns [N*explanion_rate , dims]

Return type embs

class `easycv.models.heads.mp_metric_head.MpMetricHead(with_avg_pool=False, in_channels=2048, loss_config=[{'type': 'CircleLoss', 'loss_weight': 1.0, 'norm': True, 'ddp': True, 'm': 0.4, 'gamma': 80}], input_feature_index=0, input_label_index=0, ignore_label=None)`

Bases: `torch.nn.modules.module.Module`

Simplest classifier head, with only one fc layer.

__init__(*with_avg_pool=False, in_channels=2048, loss_config=[{'type': 'CircleLoss', 'loss_weight': 1.0, 'norm': True, 'ddp': True, 'm': 0.4, 'gamma': 80}], input_feature_index=0, input_label_index=0, ignore_label=None*)

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

init_weights(*pretrained=None, init_linear='normal', std=0.01, bias=0.0*)

forward(*x*: List[torch.Tensor]) → List[torch.Tensor]

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

loss(*cls_score*, *labels*) → Dict[str, torch.Tensor]

easycv.models.heads.multi_cls_head module

```
class easycv.models.heads.multi_cls_head.MultiClsHead(pool_type='adaptive', in_indices=(0),
                                                    with_last_layer_unpool=False,
                                                    backbone='resnet50', norm_cfg={'type':
                                                    'BN'}, num_classes=1000)
```

Bases: torch.nn.modules.module.Module

Multiple classifier heads.

FEAT_CHANNELS = {'resnet50': [64, 256, 512, 1024, 2048]}

FEAT_LAST_UNPOOL = {'resnet50': 100352}

__init__(*pool_type*='adaptive', *in_indices*=(0), *with_last_layer_unpool*=False, *backbone*='resnet50',
 norm_cfg={'type': 'BN'}, *num_classes*=1000)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights()

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

loss(*cls_score*, *labels*)

training: bool

26.1.5 easycv.models.loss package

```
class easycv.models.loss.CrossEntropyLoss(use_sigmoid=False, use_mask=False, reduction='mean',
                                           class_weight=None, loss_weight=1.0, loss_name='loss_ce',
                                           avg_non_ignore=False, label_ceil=False)
```

Bases: torch.nn.modules.module.Module

CrossEntropyLoss.

Parameters

- **use_sigmoid** (*bool, optional*) – Whether the prediction uses sigmoid of softmax. Defaults to False.
- **use_mask** (*bool, optional*) – Whether to use mask cross entropy loss. Defaults to False.
- **reduction** (*str, optional*) – . Defaults to ‘mean’. Options are “none”, “mean” and “sum”.
- **class_weight** (*list[float] | str, optional*) – Weight of each class. If in str format, read them from a file. Defaults to None.
- **loss_weight** (*float, optional*) – Weight of the loss. Defaults to 1.0.
- **loss_name** (*str, optional*) – Name of the loss item. If you want this loss item to be included into the backward graph, *loss_* must be the prefix of the name. Defaults to ‘loss_ce’.
- **avg_non_ignore** (*bool*) – The flag decides to whether the loss is only averaged over non-ignored targets. Default: False. *New in version 0.23.0.*
- **label_ceil** (*bool*) – When use bce and set label_ceil=True, it will make elements belong to (0, 1] in label change to 1. Default: False.

```
__init__(use_sigmoid=False, use_mask=False, reduction='mean', class_weight=None, loss_weight=1.0,
         loss_name='loss_ce', avg_non_ignore=False, label_ceil=False)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
extra_repr()
```

Extra repr.

```
forward(cls_score, label, weight=None, avg_factor=None, reduction_override=None, ignore_index=- 100,
        **kwargs)
```

Forward function.

```
property loss_name
```

Loss Name.

This function must be implemented and will return the name of this loss function. This name will be used to combine different loss items by simple sum operation. In addition, if you want this loss item to be included into the backward graph, *loss_* must be the prefix of the name.

Returns The name of this loss item.

Return type str

```
training: bool
```

```
class easycv.models.loss.FacePoseLoss(pose_weight=1.0)
```

Bases: torch.nn.modules.module.Module

```
__init__(pose_weight=1.0)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*pred, target*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

```
class easycv.models.loss.WingLossWithPose(num_points=106, left_eye_left_corner_index=66,
                                           right_eye_right_corner_index=79, points_weight=1.0,
                                           contour_weight=1.5, eyebrow_weight=1.5, eye_weight=1.7,
                                           nose_weight=1.3, lip_weight=1.7, omega=10, epsilon=2)
```

Bases: `torch.nn.modules.module.Module`

```
__init__(num_points=106, left_eye_left_corner_index=66, right_eye_right_corner_index=79,
          points_weight=1.0, contour_weight=1.5, eyebrow_weight=1.5, eye_weight=1.7, nose_weight=1.3,
          lip_weight=1.7, omega=10, epsilon=2)
```

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

forward(*pred, target, pose*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

```
class easycv.models.loss.FocalLoss(use_sigmoid=True, gamma=2.0, alpha=0.25, reduction='mean',
                                   loss_weight=1.0, activated=False)
```

Bases: `torch.nn.modules.module.Module`

```
__init__(use_sigmoid=True, gamma=2.0, alpha=0.25, reduction='mean', loss_weight=1.0,
          activated=False)
```

Focal Loss

Parameters

- **use_sigmoid** (*bool, optional*) – Whether to the prediction is used for sigmoid or softmax. Defaults to True.
- **gamma** (*float, optional*) – The gamma for calculating the modulating factor. Defaults to 2.0.
- **alpha** (*float, optional*) – A balanced form for Focal Loss. Defaults to 0.25.
- **reduction** (*str, optional*) – The method used to reduce the loss into a scalar. Defaults to ‘mean’. Options are “none”, “mean” and “sum”.
- **loss_weight** (*float, optional*) – Weight of loss. Defaults to 1.0.
- **activated** (*bool, optional*) – Whether the input is activated. If True, it means the input has been activated and can be treated as probabilities. Else, it should be treated as logits. Defaults to False.

forward(*pred, target, weight=None, avg_factor=None, reduction_override=None*)

Forward function.

Parameters

- **pred** (*torch.Tensor*) – The prediction.
- **target** (*torch.Tensor*) – The learning label of the prediction.
- **weight** (*torch.Tensor, optional*) – The weight of loss for each prediction. Defaults to None.
- **avg_factor** (*int, optional*) – Average factor that is used to average the loss. Defaults to None.
- **reduction_override** (*str, optional*) – The reduction method used to override the original reduction method of the loss. Options are “none”, “mean” and “sum”.

Returns The calculated loss

Return type *torch.Tensor*

training: *bool*

```
class easycv.models.loss.VarifocalLoss(use_sigmoid=True, alpha=0.75, gamma=2.0,
                                       iou_weighted=True, reduction='mean', loss_weight=1.0)
```

Bases: *torch.nn.modules.module.Module*

```
__init__(use_sigmoid=True, alpha=0.75, gamma=2.0, iou_weighted=True, reduction='mean',
         loss_weight=1.0)
```

Varifocal Loss :param use_sigmoid: Whether the prediction is

used for sigmoid or softmax. Defaults to True.

Parameters

- **alpha** (*float, optional*) – A balance factor for the negative part of Varifocal Loss, which is different from the alpha of Focal Loss. Defaults to 0.75.
- **gamma** (*float, optional*) – The gamma for calculating the modulating factor. Defaults to 2.0.
- **iou_weighted** (*bool, optional*) – Whether to weight the loss of the positive examples with the iou target. Defaults to True.
- **reduction** (*str, optional*) – The method used to reduce the loss into a scalar. Defaults to ‘mean’. Options are “none”, “mean” and “sum”.
- **loss_weight** (*float, optional*) – Weight of loss. Defaults to 1.0.

forward(*pred, target, weight=None, avg_factor=None, reduction_override=None*)

Forward function. :param pred: The prediction. :type pred: *torch.Tensor* :param target: The learning target of the prediction. :type target: *torch.Tensor* :param weight: The weight of loss for each prediction. Defaults to None.

Parameters

- **avg_factor** (*int, optional*) – Average factor that is used to average the loss. Defaults to None.
- **reduction_override** (*str, optional*) – The reduction method used to override the original reduction method of the loss. Options are “none”, “mean” and “sum”.

Returns The calculated loss

Return type torch.Tensor

training: bool

class easycv.models.loss.GIoULoss(*eps=1e-06, reduction='mean', loss_weight=1.0*)

Bases: torch.nn.modules.module.Module

__init__(*eps=1e-06, reduction='mean', loss_weight=1.0*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*pred, target, weight=None, avg_factor=None, reduction_override=None, **kwargs*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.loss.IoULoss(*linear=False, eps=1e-06, reduction='mean', loss_weight=1.0, mode='log'*)

Bases: torch.nn.modules.module.Module

IoULoss.

Computing the IoU loss between a set of predicted bboxes and target bboxes.

Parameters

- **linear** (*bool*) – If True, use linear scale of loss else determined by mode. Default: False.
- **eps** (*float*) – Eps to avoid log(0).
- **reduction** (*str*) – Options are “none”, “mean” and “sum”.
- **loss_weight** (*float*) – Weight of loss.
- **mode** (*str*) – Loss scaling mode, including “linear”, “square”, and “log”. Default: ‘log’

__init__(*linear=False, eps=1e-06, reduction='mean', loss_weight=1.0, mode='log'*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*pred, target, weight=None, avg_factor=None, reduction_override=None, **kwargs*)

Forward function.

Parameters

- **pred** (*torch.Tensor*) – The prediction.
- **target** (*torch.Tensor*) – The learning target of the prediction.
- **weight** (*torch.Tensor, optional*) – The weight of loss for each prediction. Defaults to None.
- **avg_factor** (*int, optional*) – Average factor that is used to average the loss. Defaults to None.
- **reduction_override** (*str, optional*) – The reduction method used to override the original reduction method of the loss. Defaults to None. Options are “none”, “mean” and “sum”.

training: bool

class easycv.models.loss.YOLOX_IOULoss(*reduction='none', loss_type='iou'*)

Bases: torch.nn.modules.module.Module

__init__(*reduction='none', loss_type='iou'*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*pred, target*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.loss.JointsMSELoss(*use_target_weight=False, loss_weight=1.0*)

Bases: torch.nn.modules.module.Module

MSE loss for heatmaps.

Parameters

- **use_target_weight** (*bool*) – Option to use weighted MSE loss. Different joint types may have different target weights.
- **loss_weight** (*float*) – Weight of the loss. Default: 1.0.

__init__(*use_target_weight=False, loss_weight=1.0*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*output, target, target_weight*)

Forward function.

training: bool

class easycv.models.loss.FocalLoss2d(*gamma=2, weight=None, size_average=None, reduce=None, reduction='mean', num_classes=2*)

Bases: torch.nn.modules.loss._WeightedLoss

__init__(*gamma=2, weight=None, size_average=None, reduce=None, reduction='mean', num_classes=2*)

FocalLoss2d, loss solve 2-class classification unbalance problem

Parameters

- **gamma** – focal loss param Gamma
- **weight** – weight same as loss._WeightedLoss
- **size_average** – size_average same as loss._WeightedLoss
- **reduce** – reduce same as loss._WeightedLoss
- **reduction** – reduce same as loss._WeightedLoss
- **num_classes** – fix num 2

Returns Focalloss nn.module.loss object

forward(*input, target*)

input: [N * num_classes] target : [N * num_classes] one-hot

reduction: str

class easycv.models.loss.DistributeMSELoss

Bases: torch.nn.modules.module.Module

__init__()

DistributeMSELoss : for faceid age, score predict (regression by softmax)

forward(input, target)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.loss.CrossEntropyLossWithLabelSmooth(label_smooth=0.1, temperature=1.0,
with_cls=False, embedding_size=512,
num_classes=10000)

Bases: torch.nn.modules.module.Module

__init__(label_smooth=0.1, temperature=1.0, with_cls=False, embedding_size=512, num_classes=10000)

A softmax loss , with label_smooth and fc(to fit pytorch metric learning interface) :param label_smooth: label_smooth args, default=0.1 :param with_cls: if True, will generate a nn.Linear to trans input embedding from embedding_size to num_classes :param embedding_size: if input is feature not logits, then need this to indicate embedding shape :param num_classes: if input is feature not logits, then need this to indicate classification num_classes

Returns None

Raises **IOError** – An error occurred accessing the bigtable.Table object.

forward(input, target)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.loss.AMSoftmaxLoss(embedding_size=512, num_classes=100000, margin=0.35,
scale=30)

Bases: torch.nn.modules.module.Module

__init__(embedding_size=512, num_classes=100000, margin=0.35, scale=30)

AMsoftmax loss , with fc(to fit pytorch metric learning interface), paper: <https://arxiv.org/pdf/1801.05599.pdf> :param embedding_size: forward input [N, embedding_size] :param num_classes: classification num_classes :param margin: AMSoftmax param :param scale: AMSoftmax param, should increase num_classes

forward(x, lb)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

```
class easycv.models.loss.ModelParallelSoftmaxLoss(embedding_size=512, num_classes=100000,
                                                    scale=None, margin=None, bias=True)
```

Bases: `torch.nn.modules.module.Module`

```
__init__(embedding_size=512, num_classes=100000, scale=None, margin=None, bias=True)
```

ModelParallel Softmax by sailfish :param embedding_size: forward input [N, embedding_size] :param num_classes: classification num_classes

forward(*x, lb*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

```
class easycv.models.loss.ModelParallelAMSoftmaxLoss(embedding_size=512, num_classes=100000,
                                                      margin=0.35, scale=30)
```

Bases: `torch.nn.modules.module.Module`

```
__init__(embedding_size=512, num_classes=100000, margin=0.35, scale=30)
```

ModelParallel AMSoftmax by sailfish :param embedding_size: forward input [N, embedding_size] :param num_classes: classification num_classes

forward(*x, lb*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

```
class easycv.models.loss.SoftTargetCrossEntropy(num_classes=1000, **kwargs)
```

Bases: `torch.nn.modules.module.Module`

```
__init__(num_classes=1000, **kwargs)
```

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

forward(*x: torch.Tensor, target: torch.Tensor*) → `torch.Tensor`

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.loss.CDNCriterion(num_classes, matcher, weight_dict, losses, eos_coef=None, loss_class_type='ce')

Bases: [easycv.models.loss.set_criterion.set_criterion.SetCriterion](#)

This class computes the loss for Conditional DETR. The process happens in two steps:

- 1) we compute hungarian assignment between ground truth boxes and the outputs of the model
- 2) we supervise each pair of matched ground-truth / prediction (supervise class and box)

__init__(num_classes, matcher, weight_dict, losses, eos_coef=None, loss_class_type='ce')

Create the criterion. :param num_classes: number of object categories, omitting the special no-object category :param matcher: module able to compute a matching between targets and proposals :param weight_dict: dict containing as key the names of the losses and as values their relative weight. :param losses: list of all the losses to be applied. See get_loss for list of available losses.

prep_for_dn(dn_meta)

forward(outputs, targets, aux_num, num_boxes)

This performs the loss computation. :param outputs: dict of tensors, see the output specification of the model for the format :param targets: list of dicts, such that len(targets) == batch_size.

The expected keys in each dict depends on the losses applied, see each loss' doc

Parameters **return_indices** – used for vis. if True, the layer0-5 indices will be returned as well.

training: bool

class easycv.models.loss.DNCriterion(weight_dict)

Bases: [torch.nn.modules.module.Module](#)

This class computes the loss for Conditional DETR. The process happens in two steps:

- 1) we compute hungarian assignment between ground truth boxes and the outputs of the model
- 2) we supervise each pair of matched ground-truth / prediction (supervise class and box)

__init__(weight_dict)

Create the criterion. :param num_classes: number of object categories, omitting the special no-object category :param matcher: module able to compute a matching between targets and proposals :param weight_dict: dict containing as key the names of the losses and as values their relative weight. :param losses: list of all the losses to be applied. See get_loss for list of available losses.

prepare_for_loss(mask_dict)

prepare dn components to calculate loss :param mask_dict: a dict that contains dn information

tgt_loss_boxes(src_boxes, tgt_boxes, num_tgt)

Compute the losses related to the bounding boxes, the L1 regression loss and the GIoU loss targets dicts must contain the key “boxes” containing a tensor of dim [nb_target_boxes, 4] The target boxes are expected in format (center_x, center_y, w, h), normalized by the image size.

tgt_loss_labels(*src_logits_, tgt_labels_, num_tgt, focal_alpha, log=False*)

Classification loss (NLL) targets dicts must contain the key “labels” containing a tensor of dim [nb_target_boxes]

forward(*mask_dict, aux_num*)

compute dn loss in criterion :param mask_dict: a dict for dn information :param training: training or inference flag :param aux_num: aux loss number

training: bool

class easycv.models.loss.**DBLoss**(*balance_loss=True, main_loss_type='DiceLoss', alpha=5, beta=10, ohem_ratio=3, eps=1e-06, **kwargs*)

Bases: torch.nn.modules.module.Module

Differentiable Binarization (DB) Loss Function :param parm: the super paramter for DB Loss :type parm: dict

__init__(*balance_loss=True, main_loss_type='DiceLoss', alpha=5, beta=10, ohem_ratio=3, eps=1e-06, **kwargs*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

training: bool

forward(*predicts, labels*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

class easycv.models.loss.**HungarianMatcher**(*cost_dict, cost_class_type='ce_cost'*)

Bases: torch.nn.modules.module.Module

This class computes an assignment between the targets and the predictions of the network For efficiency reasons, the targets don’t include the no_object. Because of this, in general, there are more predictions than targets. In this case, we do a 1-to-1 matching of the best predictions, while the others are un-matched (and thus treated as non-objects).

__init__(*cost_dict, cost_class_type='ce_cost'*)

Creates the matcher Params:

cost_class: This is the relative weight of the classification error in the matching cost cost_bbox:

This is the relative weight of the L1 error of the bounding box coordinates in the matching cost

cost_giou: This is the relative weight of the giou loss of the bounding box in the matching cost

forward(*outputs, targets*)

Performs the matching Params:

outputs: This is a dict that contains at least these entries: “pred_logits”: Tensor of dim [batch_size, num_queries, num_classes] with the classification logits “pred_boxes”: Tensor of dim [batch_size, num_queries, 4] with the predicted box coordinates

targets: This is a list of targets (len(targets) = batch_size), where each target is a dict containing:

“labels”: Tensor of dim [num_target_boxes] (where num_target_boxes is the number of ground-truth objects in the target) containing the class labels

“boxes”: Tensor of dim [num_target_boxes, 4] containing the target box coordinates

Returns

- **index_i is the indices of the selected predictions (in order)**
 - index_j is the indices of the corresponding selected targets (in order)

For each batch element, it holds: $\text{len}(\text{index_i}) = \text{len}(\text{index_j}) = \min(\text{num_queries}, \text{num_target_boxes})$

Return type A list of size batch_size, containing tuples of (index_i, index_j) where

training: bool

```
class easycv.models.loss.SetCriterion(num_classes, matcher, weight_dict, losses, eos_coef=None,
                                     loss_class_type='ce')
```

Bases: torch.nn.modules.module.Module

This class computes the loss for Conditional DETR. The process happens in two steps:

- 1) we compute hungarian assignment between ground truth boxes and the outputs of the model
- 2) we supervise each pair of matched ground-truth / prediction (supervise class and box)

```
__init__(num_classes, matcher, weight_dict, losses, eos_coef=None, loss_class_type='ce')
```

Create the criterion. :param num_classes: number of object categories, omitting the special no-object category :param matcher: module able to compute a matching between targets and proposals :param weight_dict: dict containing as key the names of the losses and as values their relative weight. :param losses: list of all the losses to be applied. See get_loss for list of available losses.

```
loss_labels(outputs, targets, indices, num_boxes, log=True)
```

Classification loss (Binary focal loss) targets dicts must contain the key “labels” containing a tensor of dim [nb_target_boxes]

```
loss_cardinality(outputs, targets, indices, num_boxes)
```

Compute the cardinality error, ie the absolute error in the number of predicted non-empty boxes This is not really a loss, it is intended for logging purposes only. It doesn't propagate gradients

```
loss_boxes(outputs, targets, indices, num_boxes)
```

Compute the losses related to the bounding boxes, the L1 regression loss and the GIoU loss targets dicts must contain the key “boxes” containing a tensor of dim [nb_target_boxes, 4] The target boxes are expected in format (center_x, center_y, w, h), normalized by the image size.

```
loss_centerness(outputs, targets, indices, num_boxes)
```

```
loss_iouaware(outputs, targets, indices, num_boxes)
```

```
get_loss(loss, outputs, targets, indices, num_boxes, **kwargs)
```

```
forward(outputs, targets, num_boxes=None, return_indices=False)
```

This performs the loss computation. :param outputs: dict of tensors, see the output specification of the model for the format :param targets: list of dicts, such that len(targets) == batch_size.

The expected keys in each dict depends on the losses applied, see each loss' doc

Parameters return_indices – used for vis. if True, the layer0-5 indices will be returned as well.

training: bool

```
class easycv.models.loss.L1Loss(reduction='mean', loss_weight=1.0)
```

Bases: torch.nn.modules.module.Module

L1 loss.

Parameters

- **reduction** (*str*, *optional*) – The method to reduce the loss. Options are “none”, “mean” and “sum”.
- **loss_weight** (*float*, *optional*) – The weight of loss.

__init__ (*reduction='mean'*, *loss_weight=1.0*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward (*pred*, *target*, *weight=None*, *avg_factor=None*, *reduction_override=None*)

Forward function.

Parameters

- **pred** (*torch.Tensor*) – The prediction.
- **target** (*torch.Tensor*) – The learning target of the prediction.
- **weight** (*torch.Tensor*, *optional*) – The weight of loss for each prediction. Defaults to None.
- **avg_factor** (*int*, *optional*) – Average factor that is used to average the loss. Defaults to None.
- **reduction_override** (*str*, *optional*) – The reduction method used to override the original reduction method of the loss. Defaults to None.

training: `bool`

class `easycv.models.loss.MultiLoss` (*loss_config_list*, *weight_1=1.0*, *weight_2=1.0*, *gtc_loss='sar'*, ***kwargs*)

Bases: `torch.nn.modules.module.Module`

__init__ (*loss_config_list*, *weight_1=1.0*, *weight_2=1.0*, *gtc_loss='sar'*, ***kwargs*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward (*predicts*, *label_ctc=None*, *label_sar=None*, *length=None*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

class `easycv.models.loss.SmoothL1Loss` (*beta=1.0*, *reduction='mean'*, *loss_weight=1.0*)

Bases: `torch.nn.modules.module.Module`

Smooth L1 loss. :param beta: The threshold in the piecewise function.

Defaults to 1.0.

Parameters

- **reduction** (*str*, *optional*) – The method to reduce the loss. Options are “none”, “mean” and “sum”. Defaults to “mean”.
- **loss_weight** (*float*, *optional*) – The weight of loss.

__init__(*beta=1.0, reduction='mean', loss_weight=1.0*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*pred, target, weight=None, avg_factor=None, reduction_override=None, **kwargs*)

Forward function. :param pred: The prediction. :type pred: torch.Tensor :param target: The learning target of the prediction. :type target: torch.Tensor :param weight: The weight of loss for each

prediction. Defaults to None.

Parameters

- **avg_factor** (*int, optional*) – Average factor that is used to average the loss. Defaults to None.
- **reduction_override** (*str, optional*) – The reduction method used to override the original reduction method of the loss. Defaults to None.

training: bool

class easycv.models.loss.DiceLoss(*smooth=1, exponent=2, reduction='mean', class_weight=None, loss_weight=1.0, ignore_index=255, loss_name='loss_dice', **kwargs*)

Bases: torch.nn.modules.module.Module

DiceLoss.

This loss is proposed in [V-Net: Fully Convolutional Neural Networks for Volumetric Medical Image Segmentation](#).

Parameters

- **smooth** (*float*) – A float number to smooth loss, and avoid NaN error. Default: 1
- **exponent** (*float*) – An float number to calculate denominator value: $\sum\{x^{\text{exponent}}\} + \sum\{y^{\text{exponent}}\}$. Default: 2.
- **reduction** (*str, optional*) – The method used to reduce the loss. Options are “none”, “mean” and “sum”. This parameter only works when per_image is True. Default: ‘mean’.
- **class_weight** (*list[float] | str, optional*) – Weight of each class. If in str format, read them from a file. Defaults to None.
- **loss_weight** (*float, optional*) – Weight of the loss. Default to 1.0.
- **ignore_index** (*int | None*) – The label index to be ignored. Default: 255.
- **loss_name** (*str, optional*) – Name of the loss item. If you want this loss item to be included into the backward graph, *loss_* must be the prefix of the name. Defaults to ‘loss_dice’.

__init__(*smooth=1, exponent=2, reduction='mean', class_weight=None, loss_weight=1.0, ignore_index=255, loss_name='loss_dice', **kwargs*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*pred, target, avg_factor=None, reduction_override=None, **kwargs*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

property loss_name

Loss Name.

This function must be implemented and will return the name of this loss function. This name will be used to combine different loss items by simple sum operation. In addition, if you want this loss item to be included into the backward graph, *loss_* must be the prefix of the name. :returns: The name of this loss item. :rtype: str

training: bool**Submodules****easycv.models.loss.iou_loss module****class** easycv.models.loss.iou_loss.YOLOX_IOULoss(*reduction='none', loss_type='iou'*)

Bases: torch.nn.modules.module.Module

__init__(*reduction='none', loss_type='iou'*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*pred, target*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool**class** easycv.models.loss.iou_loss.IoULoss(*linear=False, eps=1e-06, reduction='mean', loss_weight=1.0, mode='log'*)

Bases: torch.nn.modules.module.Module

IoULoss.

Computing the IoU loss between a set of predicted bboxes and target bboxes.

Parameters

- **linear** (*bool*) – If True, use linear scale of loss else determined by mode. Default: False.
- **eps** (*float*) – Eps to avoid log(0).
- **reduction** (*str*) – Options are “none”, “mean” and “sum”.
- **loss_weight** (*float*) – Weight of loss.
- **mode** (*str*) – Loss scaling mode, including “linear”, “square”, and “log”. Default: ‘log’

__init__(*linear=False, eps=1e-06, reduction='mean', loss_weight=1.0, mode='log'*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*pred, target, weight=None, avg_factor=None, reduction_override=None, **kwargs*)

Forward function.

Parameters

- **pred** (*torch.Tensor*) – The prediction.
- **target** (*torch.Tensor*) – The learning target of the prediction.

- **weight** (*torch.Tensor, optional*) – The weight of loss for each prediction. Defaults to None.
- **avg_factor** (*int, optional*) – Average factor that is used to average the loss. Defaults to None.
- **reduction_override** (*str, optional*) – The reduction method used to override the original reduction method of the loss. Defaults to None. Options are “none”, “mean” and “sum”.

training: bool

class easycv.models.loss.iou_loss.**GIoULoss**(*eps=1e-06, reduction='mean', loss_weight=1.0*)

Bases: torch.nn.modules.module.Module

__init__(*eps=1e-06, reduction='mean', loss_weight=1.0*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*pred, target, weight=None, avg_factor=None, reduction_override=None, **kwargs*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

easycv.models.loss.mse_loss module

class easycv.models.loss.mse_loss.**JointsMSELoss**(*use_target_weight=False, loss_weight=1.0*)

Bases: torch.nn.modules.module.Module

MSE loss for heatmaps.

Parameters

- **use_target_weight** (*bool*) – Option to use weighted MSE loss. Different joint types may have different target weights.
- **loss_weight** (*float*) – Weight of the loss. Default: 1.0.

__init__(*use_target_weight=False, loss_weight=1.0*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*output, target, target_weight*)

Forward function.

training: bool

easycv.models.loss.pytorch_metric_learning module

```
class easycv.models.loss.pytorch_metric_learning.FocalLoss2d(gamma=2, weight=None,  
                                                         size_average=None, reduce=None,  
                                                         reduction='mean', num_classes=2)
```

Bases: torch.nn.modules.loss._WeightedLoss

```
__init__(gamma=2, weight=None, size_average=None, reduce=None, reduction='mean', num_classes=2)  
FocalLoss2d, loss solve 2-class classification unbalance problem
```

Parameters

- **gamma** – focal loss param Gamma
- **weight** – weight same as loss._WeightedLoss
- **size_average** – size_average same as loss._WeightedLoss
- **reduce** – reduce same as loss._WeightedLoss
- **reduction** – reduce same as loss._WeightedLoss
- **num_classes** – fix num 2

Returns Focalloss nn.module.loss object

weight: Optional[Tensor]

forward(*input, target*)
input: [N * num_classes] target : [N * num_classes] one-hot

reduction: str

training: bool

```
class easycv.models.loss.pytorch_metric_learning.DistributeMSELoss  
Bases: torch.nn.modules.module.Module
```

```
__init__()  
DistributeMSELoss : for faceid age, score predict (regression by softmax)
```

forward(*input, target*)
Defines the computation performed at every call.
Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.loss.pytorch_metric_learning.CrossEntropyLossWithLabelSmooth(label_smooth=0.1,  
                                                         tempera-  
                                                         ture=1.0,  
                                                         with_cls=False,

                                                         num_classes=10000)
```

Bases: torch.nn.modules.module.Module

__init__(*label_smooth=0.1, temperature=1.0, with_cls=False, embedding_size=512, num_classes=10000*)
 A softmax loss , with label_smooth and fc(to fit pytorch metric learning interface) :param label_smooth: label_smooth args, default=0.1 :param with_cls: if True, will generate a nn.Linear to trans input embedding from embedding_size to num_classes :param embedding_size: if input is feature not logits, then need this to indicate embedding shape :param num_classes: if input is feature not logits, then need this to indicate classification num_classes

Returns None

Raises **IOError** – An error occurred accessing the bigtable.Table object.

forward(*input, target*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.loss.pytorch_metric_learning.AMSoftmaxLoss(embedding_size=512,
                                                                num_classes=100000,
                                                                margin=0.35, scale=30)
```

Bases: torch.nn.modules.module.Module

__init__(*embedding_size=512, num_classes=100000, margin=0.35, scale=30*)
 AMsoftmax loss , with fc(to fit pytorch metric learning interface), paper: <https://arxiv.org/pdf/1801.05599.pdf> :param embedding_size: forward input [N, embedding_size] :param num_classes: classification num_classes :param margin: AMSoftmax param :param scale: AMSoftmax param, should increase num_classes

forward(*x, lb*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.loss.pytorch_metric_learning.ModelParallelSoftmaxLoss(embedding_size=512,
                                                                            num_classes=100000,
                                                                            scale=None,
                                                                            margin=None,
                                                                            bias=True)
```

Bases: torch.nn.modules.module.Module

__init__(*embedding_size=512, num_classes=100000, scale=None, margin=None, bias=True*)
 ModelParallel Softmax by sailfish :param embedding_size: forward input [N, embedding_size] :param num_classes: classification num_classes

forward(*x, lb*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

26.1.6 easycv.models.pose package

Subpackages

easycv.models.pose.heads package

Submodules

easycv.models.pose.heads.topdown_heatmap_base_head module

easycv.models.pose.heads.topdown_heatmap_base_head.**decode_heatmap**(*heatmaps*, *img metas*,
test_cfg)

class easycv.models.pose.heads.topdown_heatmap_base_head.**TopdownHeatmapBaseHead**

Bases: torch.nn.modules.module.Module

Base class for top-down heatmap heads.

All top-down heatmap heads should subclass it. All subclass should overwrite:

Methods:*get_loss*, supporting to calculate loss. Methods:*get_accuracy*, supporting to calculate accuracy. Methods:*forward*, supporting to forward model. Methods:*inference_model*, supporting to inference model.

abstract **get_loss**(***kwargs*)

Gets the loss.

abstract **get_accuracy**(***kwargs*)

Gets the accuracy.

abstract **forward**(***kwargs*)

Forward function.

abstract **inference_model**(***kwargs*)

Inference function.

decode(*img metas*, *output*, ***kwargs*)

Decode keypoints from heatmaps.

Parameters

- **img_metas** (*list(dict)*) – Information about data augmentation By default this includes: - “image_file”: path to the image file - “center”: center of the bbox - “scale”: scale of the bbox - “rotation”: rotation of the bbox - “bbox_score”: score of bbox
- **output** (*np.ndarray[N, K, H, W]*) – model predicted heatmaps.

training: bool

easycv.models.pose.heads.topdown_heatmap_simple_head module

```
class easycv.models.pose.heads.topdown_heatmap_simple_head.TopdownHeatmapSimpleHead(in_channels,
                                             out_channels,
                                             num_deconv_layers=3,
                                             num_deconv_filters=(256,
                                                                    256,
                                                                    256),
                                             num_deconv_kernels=(4,
                                                                    4, 4),
                                             extra=None,
                                             in_index=0,
                                             input_transform=None,
                                             align_corners=False,
                                             loss_keypoint=None,
                                             train_cfg=None,
                                             test_cfg=None)
```

Bases: [easycv.models.pose.heads.topdown_heatmap_base_head.TopdownHeatmapBaseHead](#)

Top-down heatmap simple head. paper ref: Bin Xiao et al. Simple Baselines for Human Pose Estimation and Tracking.

TopdownHeatmapSimpleHead is consisted of (≥ 0) number of deconv layers and a simple conv2d layer.

Parameters

- **in_channels** (*int*) – Number of input channels
- **out_channels** (*int*) – Number of output channels
- **num_deconv_layers** (*int*) – Number of deconv layers. num_deconv_layers should ≥ 0 . Note that 0 means no deconv layers.
- **num_deconv_filters** (*list/tuple*) – Number of filters. If num_deconv_layers > 0 , the length of
- **num_deconv_kernels** (*list/tuple*) – Kernel sizes.
- **in_index** (*int/Sequence[int]*) – Input feature index. Default: 0
- **input_transform** (*str/None*) – Transformation type of input features. Options: ‘resize_concat’, ‘multiple_select’, None. Default: None.
 - **‘resize_concat’**: Multiple feature maps will be resized to the same size as the first one and then concat together. Usually used in FCN head of HRNet.
 - **‘multiple_select’**: Multiple feature maps will be bundle into a list and passed into decode head.
 - None: Only one select feature map is allowed.
- **align_corners** (*bool*) – align_corners argument of F.interpolate. Default: False.
- **loss_keypoint** (*dict*) – Config for keypoint loss. Default: None.

```
__init__(in_channels, out_channels, num_deconv_layers=3, num_deconv_filters=(256, 256, 256),
          num_deconv_kernels=(4, 4, 4), extra=None, in_index=0, input_transform=None,
          align_corners=False, loss_keypoint=None, train_cfg=None, test_cfg=None)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

get_loss(*output, target, target_weight*)
Calculate top-down keypoint loss.

Note: batch_size: N num_keypoints: K heatmaps height: H heatmaps weight: W

Parameters

- **output** (*torch.Tensor[NxKxHxW]*) – Output heatmaps.
- **target** (*torch.Tensor[NxKxHxW]*) – Target heatmaps.
- **target_weight** (*torch.Tensor[NxKx1]*) – Weights across different joint types.

get_accuracy(*output, target, target_weight*)
Calculate accuracy for top-down keypoint loss.

Note: batch_size: N num_keypoints: K heatmaps height: H heatmaps weight: W

Parameters

- **output** (*torch.Tensor[NxKxHxW]*) – Output heatmaps.
- **target** (*torch.Tensor[NxKxHxW]*) – Target heatmaps.
- **target_weight** (*torch.Tensor[NxKx1]*) – Weights across different joint types.

forward(*x*)
Forward function.

inference_model(*x, flip_pairs=None*)
Inference function.

Returns Output heatmaps.

Return type output_heatmap (np.ndarray)

Parameters

- **x** (*torch.Tensor[NxKxHxW]*) – Input features.
- **flip_pairs** (*None | list[tuple()]*) – Pairs of keypoints which are mirrored.

training: bool

init_weights()
Initialize model weights.

Submodules

easycv.models.pose.top_down module

class easycv.models.pose.top_down.**TopDown**(*backbone, neck=None, keypoint_head=None, train_cfg=None, test_cfg=None, pretrained=None, loss_pose=None*)

Bases: [easycv.models.base.BaseModel](#)

Top-down pose detectors.

Parameters

- **backbone** (*dict*) – Backbone modules to extract feature.
- **keypoint_head** (*dict*) – Keypoint head to process feature.
- **train_cfg** (*dict*) – Config for training. Default: None.
- **test_cfg** (*dict*) – Config for testing. Default: None.
- **pretrained** (*str*) – Path to the pretrained models.
- **loss_pose** (*None*) – Deprecated arguments. Please use *loss_keypoint* for heads instead.

__init__ (*backbone=None, neck=None, keypoint_head=None, train_cfg=None, test_cfg=None, pretrained=None, loss_pose=None*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

property with_neck

Check if has keypoint_head.

property with_keypoint

Check if has keypoint_head.

init_weights()

Weight initialization for model.

forward_train (*img, target, target_weight, img metas, **kwargs*)

Defines the computation performed at every call when training.

forward_test (*img, img metas, return_heatmap=False, **kwargs*)

Defines the computation performed at every call when testing.

forward_export (*img, img metas, return_heatmap=False*)

show_result (*img, result, skeleton=None, kpt_score_thr=0.3, bbox_color='green', pose_kpt_color=None, pose_link_color=None, text_color='white', radius=4, thickness=1, font_scale=0.5, bbox_thickness=1, win_name='', show=False, show_keypoint_weight=False, wait_time=0, out_file=None*)

Draw *result* over *img*.

Parameters

- **img** (*str* or *Tensor*) – The image to be displayed.
- **result** (*list[dict]*) – The results to draw over *img* (*bbox_result*, *pose_result*).
- **skeleton** (*list[list]*) – The connection of keypoints. *skeleton* is 0-based indexing.
- **kpt_score_thr** (*float*, *optional*) – Minimum score of keypoints to be shown. Default: 0.3.
- **bbox_color** (*str* or *tuple* or *Color*) – Color of *bbox* lines.
- **pose_kpt_color** (*np.array[Nx3]*) – Color of *N* keypoints. If None, do not draw keypoints.
- **pose_link_color** (*np.array[Mx3]*) – Color of *M* links. If None, do not draw links.
- **text_color** (*str* or *tuple* or *Color*) – Color of texts.
- **radius** (*int*) – Radius of circles.
- **thickness** (*int*) – Thickness of lines.
- **font_scale** (*float*) – Font scales of texts.

- **win_name** (*str*) – The window name.
- **show** (*bool*) – Whether to show the image. Default: False.
- **show_keypoint_weight** (*bool*) – Whether to change the transparency using the predicted confidence scores of keypoints.
- **wait_time** (*int*) – Value of waitKey param. Default: 0.
- **out_file** (*str* or *None*) – The filename to write the image. Default: None.

Returns Visualized img, only if not *show* or *out_file*.

Return type Tensor

training: bool

26.1.7 easycv.models.selfsup package

Submodules

easycv.models.selfsup.byol module

class easycv.models.selfsup.byol.**BYOL**(*backbone*, *neck=None*, *head=None*, *pretrained=None*, *base_momentum=0.996*, ***kwargs*)

Bases: [easycv.models.base.BaseModel](#)

BYOL unofficial implementation. Paper: <https://arxiv.org/abs/2006.07733>

__init__(*backbone*, *neck=None*, *head=None*, *pretrained=None*, *base_momentum=0.996*, ***kwargs*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights()

forward_train(*img*, ***kwargs*)

Abstract interface for model forward in training

Parameters

- **img** (*Tensor*) – image tensor
- **kwargs** (*keyword arguments*) – Specific to concrete implementation.

forward_test(*img*, ***kwargs*)

Abstract interface for model forward in testing

Parameters

- **img** (*Tensor*) – image tensor
- **kwargs** (*keyword arguments*) – Specific to concrete implementation.

forward(*img*, *mode='train'*, ***kwargs*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

easycv.models.selfsup.dino module

class easycv.models.selfsup.dino.**MultiCropWrapper**(*backbone, head*)

Bases: torch.nn.modules.module.Module

Perform forward pass separately on each resolution input. The inputs corresponding to a single resolution are clubbed and single forward is run on the same resolution inputs. Hence we do several forward passes = number of different resolutions used. We then concatenate all the output features and run the head forward on these concatenated features.

__init__(*backbone, head*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.selfsup.dino.**DINOLoss**(*out_dim, ncrops, warmup_teacher_temp, teacher_temp, warmup_teacher_temp_epochs, nepochs, device, student_temp=0.1, center_momentum=0.9*)

Bases: torch.nn.modules.module.Module

__init__(*out_dim, ncrops, warmup_teacher_temp, teacher_temp, warmup_teacher_temp_epochs, nepochs, device, student_temp=0.1, center_momentum=0.9*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*student_output, teacher_output, epoch*)

Cross-entropy between softmax outputs of the teacher and student networks.

update_center(*teacher_output*)

Update center used for teacher output.

training: bool

easycv.models.selfsup.dino.**has_batchnorms**(*model*)

easycv.models.selfsup.dino.**get_params_groups**(*model*)

class easycv.models.selfsup.dino.**DINO**(*backbone, train_preprocess=[], neck=None, config=None, pretrained=None*)

Bases: [easycv.models.base.BaseModel](#)

__init__(*backbone, train_preprocess=[], neck=None, config=None, pretrained=None*)

Init Moby

Parameters

- **backbone** – backbone config to build vision backbone
- **train_preprocess** – [gaussBlur, mixUp, solarize]
- **neck** – neck config to build Moby Neck
- **config** – DINO parameter config

get_params_groups()

init_weights(*pretrained=None*)

init_before_train()

momentum_update_key_encoder(*m=0.999*)

ema for dino

forward_train(*inputs*)

Abstract interface for model forward in training

Parameters

- **img** (*Tensor*) – image tensor
- **kwargs** (*keyword arguments*) – Specific to concrete implementation.

forward_test(*img, **kwargs*)

Abstract interface for model forward in testing

Parameters

- **img** (*Tensor*) – image tensor
- **kwargs** (*keyword arguments*) – Specific to concrete implementation.

forward_feature(*img, **kwargs*)

Forward backbone

Returns feature tensor

Return type x (*torch.Tensor*)

training: bool

forward(*img, gt_label=None, mode='train', extract_list=['neck'], **kwargs*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

easy cv.models.selfsup.mae module

class easy cv.models.selfsup.mae.**MAE**(*backbone, neck, mask_ratio=0.75, norm_pix_loss=True, **kwargs*)

Bases: [easy cv.models.base.BaseModel](#)

__init__(*backbone, neck, mask_ratio=0.75, norm_pix_loss=True, **kwargs*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights()

patchify(*imgs*)

convert image to patch

Parameters **imgs** – (N, 3, H, W)

Returns (N, L, patch_size**2 *3)

Return type x

forward_loss(*imgs*, *pred*, *mask*)
compute loss

Parameters

- **imgs** – (N, 3, H, W)
- **pred** – (N, L, p*p*3)
- **mask** – (N, L), 0 is keep, 1 is remove,

forward_train(*img*, ***kwargs*)
Abstract interface for model forward in training

Parameters

- **img** (*Tensor*) – image tensor
- **kwargs** (*keyword arguments*) – Specific to concrete implementation.

forward_test(*img*, ***kwargs*)
Abstract interface for model forward in testing

Parameters

- **img** (*Tensor*) – image tensor
- **kwargs** (*keyword arguments*) – Specific to concrete implementation.

forward(*img*, *mode='train'*, ***kwargs*)
Defines the computation performed at every call.
Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

easycv.models.selfsup.mixco module

class easycv.models.selfsup.mixco.**MIXCO**(*backbone*, *train_preprocess=[]*, *neck=None*, *head=None*,
mixco_head=None, *pretrained=None*, *queue_len=65536*,
feat_dim=128, *momentum=0.999*, ***kwargs*)

Bases: *easycv.models.selfsup.moco.MOCO*

MOCO.

A mixup version moco <https://arxiv.org/pdf/2010.06300.pdf>

__init__(*backbone*, *train_preprocess=[]*, *neck=None*, *head=None*, *mixco_head=None*, *pretrained=None*,
queue_len=65536, *feat_dim=128*, *momentum=0.999*, ***kwargs*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward_train(*img*, ***kwargs*)
Abstract interface for model forward in training

Parameters

- **img** (*Tensor*) – image tensor
- **kwargs** (*keyword arguments*) – Specific to concrete implementation.

training: bool

easycv.models.selfsup.moby module

```
class easycv.models.selfsup.moby.MoBY(backbone, train_preprocess=[], neck=None, head=None,
                                       pretrained=None, queue_len=4096, contrast_temperature=0.2,
                                       momentum=0.99, online_drop_path_rate=0.2,
                                       target_drop_path_rate=0.0, **kwargs)
```

Bases: [easycv.models.base.BaseModel](#)

MoBY. Part of the code is borrowed from: <https://github.com/SwinTransformer/Transformer-SSL/blob/main/models/moby.py>.

```
__init__(backbone, train_preprocess=[], neck=None, head=None, pretrained=None, queue_len=4096,
          contrast_temperature=0.2, momentum=0.99, online_drop_path_rate=0.2,
          target_drop_path_rate=0.0, **kwargs)
```

Init Moby

Parameters

- **backbone** – backbone config to build vision backbone
- **train_preprocess** – [gaussBlur, mixUp, solarize]
- **neck** – neck config to build Moby Neck
- **head** – head config to build Moby Neck
- **pretrained** – pretrained weight for backbone
- **queue_len** – moby queue length
- **contrast_temperature** – contrastive_loss temperature
- **momentum** – ema target weights momentum
- **online_drop_path_rate** – for transformer based backbone, set online model drop_path_rate
- **target_drop_path_rate** – for transformer based backbone, set target model drop_path_rate

init_weights()

forward_backbone(img)

contrastive_loss(q, k, queue)

forward_train(img, **kwargs)

Abstract interface for model forward in training

Parameters

- **img** (*Tensor*) – image tensor
- **kwargs** (*keyword arguments*) – Specific to concrete implementation.

forward_test(img, **kwargs)

Abstract interface for model forward in testing

Parameters

- **img** (*Tensor*) – image tensor
- **kwargs** (*keyword arguments*) – Specific to concrete implementation.

forward_feature(*img*, ***kwargs*)

Forward backbone

Returns feature tensor

Return type x (torch.Tensor)

forward(*img*, *gt_label=None*, *mode='train'*, *extract_list=['neck']*, ***kwargs*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

`easycv.models.selfsup.moby.concat_all_gather`(*tensor*)

Performs all_gather operation on the provided tensors. * **Warning** *: torch.distributed.all_gather has no gradient.

easycv.models.selfsup.moco module

class `easycv.models.selfsup.moco.MOCO`(*backbone*, *train_preprocess=[]*, *neck=None*, *head=None*, *pretrained=None*, *queue_len=65536*, *feat_dim=128*, *momentum=0.999*, ***kwargs*)

forward_test(*img*, ***kwargs*)

Abstract interface for model forward in testing

Parameters

- **img** (*Tensor*) – image tensor
- **kwargs** (*keyword arguments*) – Specific to concrete implementation.

forward_feature(*img*, ***kwargs*)

Forward backbone

Returns feature tensor

Return type `x` (torch.Tensor)

forward(*img*, *gt_label=None*, *mode='train'*, *extract_list=['neck']*, ***kwargs*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

`easycv.models.selfsup.moco.concat_all_gather(tensor)`

Performs all_gather operation on the provided tensors. * **Warning** *: torch.distributed.all_gather has no gradient.

`easycv.models.selfsup.necks` module

class `easycv.models.selfsup.necks.DINONeck`(*in_dim*, *out_dim*, *use_bn=False*, *norm_last_layer=True*, *nlayers=3*, *hidden_dim=2048*, *bottleneck_dim=256*)

Bases: torch.nn.modules.module.Module

__init__(*in_dim*, *out_dim*, *use_bn=False*, *norm_last_layer=True*, *nlayers=3*, *hidden_dim=2048*, *bottleneck_dim=256*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

class `easycv.models.selfsup.necks.MoBYMLP`(*in_channels=256*, *hid_channels=4096*, *out_channels=256*, *num_layers=2*, *with_avg_pool=True*)

Bases: torch.nn.modules.module.Module

__init__(*in_channels=256*, *hid_channels=4096*, *out_channels=256*, *num_layers=2*, *with_avg_pool=True*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

init_weights(*init_linear='normal'*)

training: `bool`

```
class easycv.models.selfsup.necks.NonLinearNeckSwav(in_channels, hid_channels, out_channels,  
                                                    with_avg_pool=True, export=False)
```

Bases: torch.nn.modules.module.Module

The non-linear neck in byol: fc-synclbn-relu-fc

```
__init__(in_channels, hid_channels, out_channels, with_avg_pool=True, export=False)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
init_weights(init_linear='normal')
```

```
forward(x)
```

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.selfsup.necks.NonLinearNeckV0(in_channels, hid_channels, out_channels,  
                                                  sync_bn=False, with_avg_pool=True)
```

Bases: torch.nn.modules.module.Module

The non-linear neck in ODC, fc-bn-relu-dropout-fc-relu

```
__init__(in_channels, hid_channels, out_channels, sync_bn=False, with_avg_pool=True)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
init_weights(init_linear='normal')
```

```
forward(x)
```

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

```
class easycv.models.selfsup.necks.NonLinearNeckV1(in_channels, hid_channels, out_channels,  
                                                  with_avg_pool=True)
```

Bases: torch.nn.modules.module.Module

The non-linear neck in MoCO v2: fc-relu-fc

```
__init__(in_channels, hid_channels, out_channels, with_avg_pool=True)
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
init_weights(init_linear='normal')
```

```
forward(x)
```

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.selfsup.necks.**NonLinearNeckV2**(*in_channels, hid_channels, out_channels,*
with_avg_pool=True)

Bases: torch.nn.modules.module.Module

The non-linear neck in byol: fc-bn-relu-fc

__init__(*in_channels, hid_channels, out_channels, with_avg_pool=True*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights(*init_linear='normal'*)

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.selfsup.necks.**NonLinearNeckSimCLR**(*in_channels, hid_channels, out_channels,*
num_layers=2, with_avg_pool=True)

Bases: torch.nn.modules.module.Module

SimCLR non-linear neck.

Structure: fc(no_bias)-bn(has_bias)-[relu-fc(no_bias)-bn(no_bias)]. The substructures in [] can be repeated. For the SimCLR default setting, the repeat time is 1.

However, PyTorch does not support to specify (weight=True, bias=False). It only support “affine” including the weight and bias. Hence, the second BatchNorm has bias in this implementation. This is different from the official implementation of SimCLR.

Since SyncBatchNorm in pytorch<1.4.0 does not support 2D input, the input is expanded to 4D with shape: (N,C,1,1). I am not sure if this workaround has no bugs. See the pull request here: <https://github.com/pytorch/pytorch/pull/29626>

Parameters

- **in_channels** – input channel number
- **hid_channels** – hidden channels
- **out_channels** – output channel number
- **num_layers** (*int*) – number of fc layers, it is 2 in the SimCLR default setting.
- **with_avg_pool** – output with average pooling

__init__(*in_channels, hid_channels, out_channels, num_layers=2, with_avg_pool=True*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights(*init_linear='normal'*)

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.selfsup.necks.**RelativeLocNeck**(*in_channels, out_channels, sync_bn=False, with_avg_pool=True*)

Bases: torch.nn.modules.module.Module

Relative patch location neck: fc-bn-relu-dropout

__init__(*in_channels, out_channels, sync_bn=False, with_avg_pool=True*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights(*init_linear='normal'*)

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.selfsup.necks.**MAENeck**(*num_patches, embed_dim=768, patch_size=16, in_chans=3, decoder_embed_dim=512, decoder_depth=8, decoder_num_heads=16, mlp_ratio=4.0, norm_layer=functools.partial(<class 'torch.nn.modules.normalization.LayerNorm'>, eps=1e-06))*)

Bases: torch.nn.modules.module.Module

MAE decoder

Parameters

- **num_patches** (*int*) – number of patches from encoder
- **embed_dim** (*int*) – encoder embedding dimension
- **patch_size** (*int*) – encoder patch size
- **in_chans** (*int*) – input image channels
- **decoder_embed_dim** (*int*) – decoder embedding dimension
- **decoder_depth** (*int*) – number of decoder layers
- **decoder_num_heads** (*int*) – Parallel attention heads
- **mlp_ratio** (*float*) – mlp ratio

- **norm_layer** – type of normalization layer

```
__init__(num_patches, embed_dim=768, patch_size=16, in_chans=3, decoder_embed_dim=512,  
         decoder_depth=8, decoder_num_heads=16, mlp_ratio=4.0, norm_layer=functools.partial(<class  
         'torch.nn.modules.normalization.LayerNorm'>, eps=1e-06))
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
init_weights()
```

```
training: bool
```

```
forward(x, ids_restore)
```

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

```
class easycv.models.selfsup.necks.FastConvMAENeck(num_patches, embed_dim=768, patch_size=16,  
         in_channels=3, decoder_embed_dim=512,  
         decoder_depth=8, decoder_num_heads=16,  
         mlp_ratio=4.0,  
         norm_layer=functools.partial(<class  
         'torch.nn.modules.normalization.LayerNorm'>,  
         eps=1e-06))
```

Bases: [easycv.models.selfsup.necks.MAENeck](#)

Fast ConvMAE decoder, refer to: <https://github.com/Alpha-VL/FastConvMAE>

Parameters

- **num_patches** (*int*) – number of patches from encoder
- **embed_dim** (*int*) – encoder embedding dimension
- **patch_size** (*int*) – encoder patch size
- **in_channels** (*int*) – input image channels
- **decoder_embed_dim** (*int*) – decoder embedding dimension
- **decoder_depth** (*int*) – number of decoder layers
- **decoder_num_heads** (*int*) – Parallel attention heads
- **mlp_ratio** (*float*) – mlp ratio
- **norm_layer** – type of normalization layer

```
training: bool
```

```
__init__(num_patches, embed_dim=768, patch_size=16, in_channels=3, decoder_embed_dim=512,  
         decoder_depth=8, decoder_num_heads=16, mlp_ratio=4.0, norm_layer=functools.partial(<class  
         'torch.nn.modules.normalization.LayerNorm'>, eps=1e-06))
```

Initializes internal Module state, shared by both nn.Module and ScriptModule.

```
init_weights()
```

```
forward(x, ids_restore)
```

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

easy cv.models.selfsup.simclr module

class easy cv.models.selfsup.simclr.**SimCLR**(backbone, train_preprocess=[], neck=None, head=None, pretrained=None)

Bases: [easy cv.models.base.BaseModel](#)

__init__(backbone, train_preprocess=[], neck=None, head=None, pretrained=None)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights()

forward_backbone(img)

Forward backbone

Returns backbone outputs

Return type x (tuple)

forward_train(img, **kwargs)

Abstract interface for model forward in training

Parameters

- **img** (*Tensor*) – image tensor
- **kwargs** (*keyword arguments*) – Specific to concrete implementation.

forward_test(img, **kwargs)

Abstract interface for model forward in testing

Parameters

- **img** (*Tensor*) – image tensor
- **kwargs** (*keyword arguments*) – Specific to concrete implementation.

forward(img, mode='train', **kwargs)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

easycv.models.selfsup.swav module

class easycv.models.selfsup.swav.**SWAV**(backbone, train_preprocess=[], neck=None, config=None, pretrained=None)

Bases: [easycv.models.base.BaseModel](#)

__init__(backbone, train_preprocess=[], neck=None, config=None, pretrained=None)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

init_weights()

forward_backbone(img)

forward_train_model(inputs)

forward_train(inputs)

Abstract interface for model forward in training

Parameters

- **img** (Tensor) – image tensor
- **kwargs** (keyword arguments) – Specific to concrete implementation.

forward_test(img, **kwargs)

Abstract interface for model forward in testing

Parameters

- **img** (Tensor) – image tensor
- **kwargs** (keyword arguments) – Specific to concrete implementation.

forward_feature(img, **kwargs)

Forward backbone

Returns feature tensor

Return type x (torch.Tensor)

forward(img, gt_label=None, mode='train', extract_list=['neck'], **kwargs)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.selfsup.swav.**MultiPrototypes**(output_dim, nmb_prototypes)

Bases: torch.nn.modules.module.Module

__init__(output_dim, nmb_prototypes)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

`easycv.models.selfsup.swav.distributed_sinkhorn(Q, nmb_iters)`

26.1.8 easycv.models.utils package

Submodules

easycv.models.utils.accuracy module

easycv.models.utils.activation module

class `easycv.models.utils.activation.FReLU(in_channel)`

Bases: `torch.nn.modules.module.Module`

__init__(*in_channel*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

`easycv.models.utils.activation.build_activation_layer(cfg)`

Build activation layer.

Parameters `cfg (dict)` – The activation layer config, which should contain: - `type (str)`: Layer type. - `layer args`: Args needed to instantiate an activation layer.

Returns Created activation layer.

Return type `nn.Module`

easycv.models.utils.conv_module module

`easycv.models.utils.conv_module.build_conv_layer(cfg, *args, **kwargs)`

Build convolution layer

Parameters `cfg (None or dict)` – `cfg` should contain: `type (str)`: identify conv layer type. `layer args`: args needed to instantiate a conv layer.

Returns created conv layer

Return type layer (`nn.Module`)

```
class easycv.models.utils.conv_module.ConvModule(in_channels, out_channels, kernel_size, stride=1,
                                                padding=0, dilation=1, groups=1, bias='auto',
                                                conv_cfg=None, norm_cfg=None, act_cfg={'type':
                                                'ReLU'}, inplace=True, order=('conv', 'norm', 'act'))
```

Bases: `torch.nn.modules.module.Module`

A conv block that contains conv/norm/activation layers.

Parameters

- **in_channels** (*int*) – Same as `nn.Conv2d`.
- **out_channels** (*int*) – Same as `nn.Conv2d`.
- **kernel_size** (*int* or *tuple[int]*) – Same as `nn.Conv2d`.
- **stride** (*int* or *tuple[int]*) – Same as `nn.Conv2d`.
- **padding** (*int* or *tuple[int]*) – Same as `nn.Conv2d`.
- **dilation** (*int* or *tuple[int]*) – Same as `nn.Conv2d`.
- **groups** (*int*) – Same as `nn.Conv2d`.
- **bias** (*bool* or *str*) – If specified as *auto*, it will be decided by the `norm_cfg`. Bias will be set as `True` if `norm_cfg` is `None`, otherwise `False`.
- **conv_cfg** (*dict*) – Config dict for convolution layer.
- **norm_cfg** (*dict*) – Config dict for normalization layer.
- **act_cfg** (*dict*) – Config of activation layers. Default: `dict(type='ReLU')`
- **inplace** (*bool*) – Whether to use inplace mode for activation.
- **order** (*tuple[str]*) – The order of conv/norm/activation layers. It is a sequence of “conv”, “norm” and “act”. Examples are (“conv”, “norm”, “act”) and (“act”, “conv”, “norm”).

```
__init__(in_channels, out_channels, kernel_size, stride=1, padding=0, dilation=1, groups=1, bias='auto',
         conv_cfg=None, norm_cfg=None, act_cfg={'type': 'ReLU'}, inplace=True, order=('conv', 'norm',
         'act'))
```

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

property `norm`

init_weights()

forward(*x*, *activate=True*, *norm=True*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

easycv.models.utils.conv_ws module

`easycv.models.utils.conv_ws.conv_ws_2d(input, weight, bias=None, stride=1, padding=0, dilation=1, groups=1, eps=1e-05)`

class `easycv.models.utils.conv_ws.ConvWS2d(in_channels, out_channels, kernel_size, stride=1, padding=0, dilation=1, groups=1, bias=True, eps=1e-05)`

Bases: `torch.nn.modules.conv.Conv2d`

__init__(*in_channels, out_channels, kernel_size, stride=1, padding=0, dilation=1, groups=1, bias=True, eps=1e-05*)

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

forward(*x*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

bias: `Optional[torch.Tensor]`

in_channels: `int`

out_channels: `int`

kernel_size: `Tuple[int, ...]`

stride: `Tuple[int, ...]`

padding: `Union[str, Tuple[int, ...]]`

dilation: `Tuple[int, ...]`

transposed: `bool`

output_padding: `Tuple[int, ...]`

groups: `int`

padding_mode: `str`

weight: `torch.Tensor`

easycv.models.utils.dist_utils module

`easycv.models.utils.dist_utils.all_gather(embeddings, labels)`

`easycv.models.utils.dist_utils.all_gather_embeddings_labels(embeddings, labels)`

class `easycv.models.utils.dist_utils.DistributedLossWrapper(loss, **kwargs)`

Bases: `torch.nn.modules.module.Module`

__init__(*loss, **kwargs*)

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

forward(*embeddings, labels, *args, **kwargs*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

class `easycv.models.utils.dist_utils.DistributedMinerWrapper(miner)`

Bases: `torch.nn.modules.module.Module`

__init__(*miner*)

Initializes internal `Module` state, shared by both `nn.Module` and `ScriptModule`.

forward(*embeddings, labels, ref_emb=None, ref_labels=None*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the `Module` instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: `bool`

`easycv.models.utils.dist_utils.reduce_mean(tensor)`

“Obtain the mean of tensor on different GPUs.

`easycv.models.utils.gather_layer` module

class `easycv.models.utils.gather_layer.GatherLayer(*args, **kwargs)`

Bases: `torch.autograd.function.Function`

Gather tensors from all process, supporting backward propagation.

static forward(*ctx, input*)

Performs the operation.

This function is to be overridden by all subclasses.

It must accept a context `ctx` as the first argument, followed by any number of arguments (tensors or other types).

The context can be used to store arbitrary data that can be then retrieved during the backward pass. Tensors should not be stored directly on `ctx` (though this is not currently enforced for backward compatibility). Instead, tensors should be saved either with `ctx.save_for_backward()` if they are intended to be used in backward (equivalently, `vjp`) or `ctx.save_for_forward()` if they are intended to be used for in `jvp`.

static backward(*ctx, *grads*)

Defines a formula for differentiating the operation with backward mode automatic differentiation (alias to the `vjp` function).

This function is to be overridden by all subclasses.

It must accept a context `ctx` as the first argument, followed by as many outputs as the `forward()` returned (None will be passed in for non tensor outputs of the forward function), and it should return as many tensors, as there were inputs to `forward()`. Each argument is the gradient w.r.t the given output, and each returned value should be the gradient w.r.t. the corresponding input. If an input is not a Tensor or is a Tensor not requiring grads, you can just pass None as a gradient for that input.

The context can be used to retrieve tensors saved during the forward pass. It also has an attribute `ctx.needs_input_grad` as a tuple of booleans representing whether each input needs gradient. E.g., `backward()` will have `ctx.needs_input_grad[0] = True` if the first input to `forward()` needs gradient computed w.r.t. the output.

easycv.models.utils.init_weights module

`easycv.models.utils.init_weights.trunc_normal_(tensor, mean=0.0, std=1.0, a=- 2.0, b=2.0)`

easycv.models.utils.multi_pooling module

class `easycv.models.utils.multi_pooling.GeMPooling(p=3, eps=1e-06)`

Bases: `torch.nn.modules.module.Module`

GemPooling used for image retrieval $p = 1$, avgpooling $p > 1$: increases the contrast of the pooled feature map and focuses on the salient features of the image $p = \text{infinite}$: spatial max-pooling layer

__init__(p=3, eps=1e-06)

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

gem(x, p=3, eps=1e-06)

training: bool

class `easycv.models.utils.multi_pooling.MultiPooling(pool_type='adaptive', in_indices=(0), backbone='resnet50')`

Bases: `torch.nn.modules.module.Module`

Pooling layers for features from multiple depth.

POOL_PARAMS = {'resnet50': [{'kernel_size': 10, 'stride': 10, 'padding': 4}, {'kernel_size': 16, 'stride': 8, 'padding': 0}, {'kernel_size': 13, 'stride': 5, 'padding': 0}, {'kernel_size': 8, 'stride': 3, 'padding': 0}, {'kernel_size': 6, 'stride': 1, 'padding': 0}]}

POOL_SIZES = {'resnet50': [12, 6, 4, 3, 2]}

POOL_DIMS = {'resnet50': [9216, 9216, 8192, 9216, 8192]}

__init__(pool_type='adaptive', in_indices=(0), backbone='resnet50')

Initializes internal Module state, shared by both `nn.Module` and `ScriptModule`.

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.utils.multi_pooling.**MultiAvgPooling**(pool_type='adaptive', in_indices=(0), backbone='resnet50')

Bases: torch.nn.modules.module.Module

Pooling layers for features from multiple depth.

POOL_PARAMS = {'resnet50': [{'kernel_size': 10, 'stride': 10, 'padding': 4}, {'kernel_size': 16, 'stride': 8, 'padding': 0}, {'kernel_size': 13, 'stride': 5, 'padding': 0}, {'kernel_size': 8, 'stride': 3, 'padding': 0}, {'kernel_size': 7, 'stride': 1, 'padding': 0}]}

POOL_SIZES = {'resnet50': [12, 6, 4, 3, 1]}

POOL_DIMS = {'resnet50': [9216, 9216, 8192, 9216, 2048]}

__init__(pool_type='adaptive', in_indices=(0), backbone='resnet50')

Initializes internal Module state, shared by both nn.Module and ScriptModule.

training: bool

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

easycv.models.utils.norm module

class easycv.models.utils.norm.**SyncIBN**(planes, ratio=0.5, eps=1e-05)

Bases: torch.nn.modules.module.Module

Instance-Batch Normalization layer from “Two at Once: Enhancing Learning and Generalization Capacities via IBN-Net” <<https://arxiv.org/pdf/1807.09441.pdf>> :param planes: Number of channels for the input tensor :type planes: int :param ratio: Ratio of instance normalization in the IBN layer :type ratio: float

__init__(planes, ratio=0.5, eps=1e-05)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

class easycv.models.utils.norm.**IBN**(planes, ratio=0.5, eps=1e-05)

Bases: torch.nn.modules.module.Module

Instance-Batch Normalization layer from “Two at Once: Enhancing Learning and Generalization Capacities via IBN-Net” <<https://arxiv.org/pdf/1807.09441.pdf>> :param planes: Number of channels for the input tensor :type planes: int :param ratio: Ratio of instance normalization in the IBN layer :type ratio: float

__init__(planes, ratio=0.5, eps=1e-05)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

easycv.models.utils.norm.**build_norm_layer**(cfg, num_features, postfix="")

Build normalization layer

Parameters

- **cfg** (*dict*) – cfg should contain: type (str): identify norm layer type. layer args: args needed to instantiate a norm layer. requires_grad (bool): [optional] whether stop gradient updates
- **num_features** (*int*) – number of channels from input.
- **postfix** (*int*, *str*) – appended into norm abbreviation to create named layer.

Returns abbreviation + postfix layer (nn.Module): created norm layer

Return type name (str)

easycv.models.utils.ops module

easycv.models.utils.ops.**resize_tensor**(input, size=None, scale_factor=None, mode='nearest', align_corners=None, warning=True)

Resize tensor with F.interpolate.

Parameters

- **input** (*Tensor*) – the input tensor.
- **size** (*Tuple[int, int]*) – output spatial size.
- **scale_factor** (*float or Tuple[float]*) – multiplier for spatial size. If scale_factor is a tuple, its length has to match input.dim().
- **mode** (*str*) – algorithm used for upsampling: ‘nearest’ | ‘linear’ | ‘bilinear’ | ‘bicubic’ | ‘trilinear’ | ‘area’. Default: ‘nearest’
- **align_corners** (*bool*) – Geometrically, we consider the pixels of the input and output as squares rather than points. If set to True, the input and output tensors are aligned by the center points of their corner pixels, preserving the values at the corner pixels.

If set to False, the input and output tensors are aligned by the corner points of their corner pixels, and the interpolation uses edge value padding for out-of-boundary values, making this operation independent of input size when `scale_factor` is kept the same. This only has an effect when mode is 'linear', 'bilinear', 'bicubic' or 'trilinear'.

`easycv.models.utils.ops.make_divisible(x, divisor)`

`easycv.models.utils.pos_embed` module

`easycv.models.utils.pos_embed.get_2d_sincos_pos_embed(embed_dim, grid_size, cls_token=False)`
grid_size: int of the grid height and width return: pos_embed: [grid_size*grid_size, embed_dim] or [1+grid_size*grid_size, embed_dim] (w/ or w/o cls_token)

`easycv.models.utils.pos_embed.get_2d_sincos_pos_embed_from_grid(embed_dim, grid)`

`easycv.models.utils.pos_embed.get_1d_sincos_pos_embed_from_grid(embed_dim, pos)`
embed_dim: output dimension for each position pos: a list of positions to be encoded: size (M,) out: (M, D)

`easycv.models.utils.pos_embed.interpolate_pos_embed(model, checkpoint_model)`

`easycv.models.utils.res_layer` module

class `easycv.models.utils.res_layer.ResLayer`(*block, num_blocks, in_channels, out_channels, expansion=None, stride=1, avg_down=False, conv_cfg=None, norm_cfg={'type': 'BN'}, **kwargs*)

Bases: `torch.nn.modules.container.Sequential`

ResLayer to build ResNet style backbone. :param block: Residual block used to build ResLayer. :type block: nn.Module :param num_blocks: Number of blocks. :type num_blocks: int :param in_channels: Input channels of this block. :type in_channels: int :param out_channels: Output channels of this block. :type out_channels: int :param expansion: The expansion for BasicBlock/Bottleneck.

If not specified, it will firstly be obtained via `block.expansion`. If the block has no attribute “expansion”, the following default values will be used: 1 for BasicBlock and 4 for Bottleneck. Default: None.

Parameters

- **stride** (*int*) – stride of the first block. Default: 1.
- **avg_down** (*bool*) – Use AvgPool instead of stride conv when downsampling in the bottleneck. Default: False
- **conv_cfg** (*dict, optional*) – dictionary to construct and config conv layer. Default: None
- **norm_cfg** (*dict*) – dictionary to construct and config norm layer. Default: dict(type='BN')

__init__(*block, num_blocks, in_channels, out_channels, expansion=None, stride=1, avg_down=False, conv_cfg=None, norm_cfg={'type': 'BN'}, **kwargs*)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

easycv.models.utils.scale module

class easycv.models.utils.scale.**Scale**(scale=1.0)

Bases: torch.nn.modules.module.Module

A learnable scale parameter

__init__(scale=1.0)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

easycv.models.utils.sobel module

class easycv.models.utils.sobel.**Sobel**

Bases: torch.nn.modules.module.Module

__init__()

Initializes internal Module state, shared by both nn.Module and ScriptModule.

forward(x)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

training: bool

26.2 Submodules

26.3 easycv.models.base module

class easycv.models.base.**BaseModel**(init_cfg=None)

Bases: torch.nn.modules.module.Module

base class for model.

__init__(init_cfg=None)

Initializes internal Module state, shared by both nn.Module and ScriptModule.

property is_init: bool

init_weights()

abstract forward_train(*img: torch.Tensor, **kwargs*) → Dict[str, torch.Tensor]

Abstract interface for model forward in training

Parameters

- **img** (*Tensor*) – image tensor
- **kwargs** (*keyword arguments*) – Specific to concrete implementation.

forward_test(*img: torch.Tensor, **kwargs*) → Dict[str, torch.Tensor]

Abstract interface for model forward in testing

Parameters

- **img** (*Tensor*) – image tensor
- **kwargs** (*keyword arguments*) – Specific to concrete implementation.

forward(*mode='train', *args, **kwargs*)

Defines the computation performed at every call.

Should be overridden by all subclasses.

Note: Although the recipe for forward pass needs to be defined within this function, one should call the Module instance afterwards instead of this since the former takes care of running the registered hooks while the latter silently ignores them.

train_step(*data, optimizer*)

The iteration step during training.

This method defines an iteration step during training, except for the back propagation and optimizer updating, which are done in an optimizer hook. Note that in some complicated cases or models, the whole process including back propagation and optimizer updating is also defined in this method, such as GAN.

Parameters

- **data** (*dict*) – The output of dataloader.
- **optimizer** (*torch.optim.Optimizer | dict*) – The optimizer of runner is passed to `train_step()`. This argument is unused and reserved.

Returns

It should contain at least 3 keys: `loss`, `log_vars`, `num_samples`.

- `loss` is a tensor for back propagation, which can be a weighted sum of multiple losses.
- `log_vars` contains all the variables to be sent to the logger.
- `num_samples` indicates the batch size (when the model is DDP, it means the batch size on each GPU), which is used for averaging the logs.

Return type dict

val_step(*data, optimizer*)

The iteration step during validation.

This method shares the same signature as `train_step()`, but used during val epochs. Note that the evaluation after training epochs is not implemented with this method, but an evaluation hook.

show_result(***kwargs*)

Visualize the results.

training: bool

26.4 easycv.models.builder module

`easycv.models.builder.build(cfg, registry, default_args=None)`

`easycv.models.builder.build_backbone(cfg)`

`easycv.models.builder.build_neck(cfg)`

`easycv.models.builder.build_head(cfg)`

`easycv.models.builder.build_loss(cfg)`

`easycv.models.builder.build_model(cfg)`

`easycv.models.builder.build_voxel_encoder(cfg)`

Build voxel encoder.

`easycv.models.builder.build_middle_encoder(cfg)`

Build middle level encoder.

`easycv.models.builder.build_fusion_layer(cfg)`

Build fusion layer.

`easycv.models.builder.build_transformer(cfg, default_args=None)`

Builder for Transformer.

`easycv.models.builder.build_positional_encoding(cfg, default_args=None)`

Builder for Position Encoding.

`easycv.models.builder.build_attention(cfg, default_args=None)`

Builder for attention.

`easycv.models.builder.build_feedforward_network(cfg, default_args=None)`

Builder for feed-forward network (FFN).

`easycv.models.builder.build_transformer_layer(cfg, default_args=None)`

Builder for transformer layer.

`easycv.models.builder.build_transformer_layer_sequence(cfg, default_args=None)`

Builder for transformer encoder and transformer decoder.

26.5 easycv.models.modelzoo module

26.6 easycv.models.registry module

EASYCV.UTILS PACKAGE

27.1 Submodules

27.2 `easycv.utils.alias_multinomial` module

class `easycv.utils.alias_multinomial.AliasMethod(probs)`

Bases: `object`

<https://hips.seas.harvard.edu/blog/2013/03/03/the-alias-method-efficient-sampling-with-many-discrete-outcomes/>

__init__(*probs*)

Initialize self. See `help(type(self))` for accurate signature.

cuda()

draw(*N*)

Draw *N* samples from multinomial

27.3 `easycv.utils.bbox_util` module

27.4 `easycv.utils.checkpoint` module

`easycv.utils.checkpoint.get_checkpoint(filename)`

`easycv.utils.checkpoint.load_checkpoint(model, filename, map_location='cpu', strict=False, logger=None, revise_keys=[("module\\", "")])`

Load checkpoint from a file or URI.

Parameters

- **model** (*Module*) – Module to load checkpoint.
- **filename** (*str*) – Accept local filepath, URL, `torchvision://xxx`, `open-mmlab://xxx`. Please refer to `docs/model_zoo.md` for details.
- **map_location** (*str*) – Same as `torch.load()`.
- **strict** (*bool*) – Whether to allow different params for the model and checkpoint.
- **logger** (`logging.Logger` or `None`) – The logger for error message.

- **revise_keys** (*list*) – A list of customized keywords to modify the `state_dict` in checkpoint. Each item is a (pattern, replacement) pair of the regular expression operations. Default: strip the prefix ‘module.’ by `[(r'^module.', '')]`.

Returns The loaded checkpoint.

Return type dict or OrderedDict

`easycv.utils.checkpoint.save_checkpoint(model, filename, optimizer=None, meta=None)`

Save checkpoint to file.

The checkpoint will have 3 fields: `meta`, `state_dict` and `optimizer`. By default `meta` will contain version and time info.

Parameters

- **model** (*Module*) – Module whose params are to be saved.
- **filename** (*str*) – Checkpoint filename.
- **optimizer** (*Optimizer*, optional) – Optimizer to be saved.
- **meta** (*dict*, optional) – Metadata to be saved in checkpoint.

27.5 easycv.utils.collect module

`easycv.utils.collect.nondist_forward_collect(func, data_loader, length)`

Forward and collect network outputs.

This function performs forward propagation and collects outputs. It can be used to collect results, features, losses, etc.

Parameters

- **func** (*function*) – The function to process data. The output must be a dictionary of CPU tensors.
- **length** (*int*) – Expected length of output arrays.

Returns The concatenated outputs.

Return type results_all (dict(np.ndarray))

`easycv.utils.collect.dist_forward_collect(func, data_loader, rank, length, ret_rank=-1)`

Forward and collect network outputs in a distributed manner.

This function performs forward propagation and collects outputs. It can be used to collect results, features, losses, etc.

Parameters

- **func** (*function*) – The function to process data. The output must be a dictionary of CPU tensors.
- **rank** (*int*) – This process id.
- **length** (*int*) – Expected length of output arrays.
- **ret_rank** (*int*) – The process that returns. Other processes will return None.

Returns The concatenated outputs.

Return type results_all (dict(np.ndarray))

27.6 easycv.utils.collect_env module

`easycv.utils.collect_env.collect_env()`

27.7 easycv.utils.config_tools module

`easycv.utils.config_tools.traverse_replace(d, key, value)`

class `easycv.utils.config_tools.WrapperConfig(cfg_dict=None, cfg_text=None, filename=None)`
 Bases: `mmcv.utils.config.Config`

A facility for config and config files. It supports common file formats as configs: python/json/yaml. The interface is the same as a dict object and also allows access config values as attributes. .. rubric:: Example

```
>>> cfg = Config(dict(a=1, b=dict(b1=[0, 1])))
>>> cfg.a
1
>>> cfg.b
{'b1': [0, 1]}
>>> cfg.b.b1
[0, 1]
>>> cfg = Config.fromfile('tests/data/config/a.py')
>>> cfg.filename
"/home/kchen/projects/mmcv/tests/data/config/a.py"
>>> cfg.item4
'test'
>>> cfg
"Config [path: /home/kchen/projects/mmcv/tests/data/config/a.py]: "
"{'item1': [1, 2], 'item2': {'a': 0}, 'item3': True, 'item4': 'test'}"
```

`easycv.utils.config_tools.check_base_cfg_path(base_cfg_name='configs/base.py',
 father_cfg_name=None, easycv_root=None)`

Concatenate paths by parsing path rules. for example(pseudo-code):

1. 'configs' in base_cfg_name or 'benchmarks' in base_cfg_name: base_cfg_name = easycv_root + base_cfg_name
2. 'configs' not in base_cfg_name and 'benchmarks' not in base_cfg_name: base_cfg_name = father_cfg_name + base_cfg_name

`easycv.utils.config_tools.mmcv_file2dict_raw(filename, first_order_params=None)`

`easycv.utils.config_tools.mmcv_file2dict_base(ori_filename, first_order_params=None,
 easycv_root=None)`

`easycv.utils.config_tools.grouping_params(user_config_params)`

`easycv.utils.config_tools.adapt_pai_params(cfg_dict)`

Parameters `cfg_dict (dict)` – All parameters of cfg.

Returns Add the cfg of export and oss.

Return type `cfg_dict (dict)`

`easycv.utils.config_tools.init_path(ori_filename)`

`easycv.utils.config_tools.mmcv_config_fromfile(ori_filename)`

```
easycv.utils.config_tools.pai_config_fromfile(ori_filename, user_config_params=None,
                                              model_type=None)

easycv.utils.config_tools.get_config_class_value(cfg_dict, ori_key, dict_mem_helper)

easycv.utils.config_tools.config_dict_edit(ori_cfg_dict, cfg_dict, reg, dict_mem_helper)
    edit ${configs.variables} in config dict to solve dependencies in config ori_cfg_dict: to find the true value of
    ${configs.variables} cfg_dict: for find leafs of dict by recursive reg: Regular expression pattern for find all
    ${configs.variables} in leafs of dict dict_mem_helper: to store the true value of ${configs.variables} which have
    been found

easycv.utils.config_tools.rebuild_config(cfg, user_config_params)
    # rebuild config by user config params, modify config by user config params & replace ${configs.variables} by
    true value return: Config

easycv.utils.config_tools.validate_export_config(cfg)
```

27.8 easycv.utils.constant module

27.9 easycv.utils.dist_utils module

```
easycv.utils.dist_utils.is_master()
easycv.utils.dist_utils.local_rank()
easycv.utils.dist_utils.dist_zero_exec(rank=0)
easycv.utils.dist_utils.get_num_gpu_per_node()
    get number of gpu per node
easycv.utils.dist_utils.barrier()
easycv.utils.dist_utils.is_parallel(model)
easycv.utils.dist_utils.obj2tensor(pyobj, device='cuda')
    Serialize picklable python object to tensor.
easycv.utils.dist_utils.tensor2obj(tensor)
    Deserialize tensor to picklable python object.
easycv.utils.dist_utils.all_reduce_dict(py_dict, op='sum', group=None, to_float=True)
    Apply all reduce function for python dict object.
```

The code is modified from https://github.com/Megvii-BaseDetection/YOLOX/blob/main/yolox/utils/allreduce_norm.py.

NOTE: make sure that py_dict in different ranks has the same keys and the values should be in the same shape.

Parameters

- **py_dict** (*dict*) – Dict to be applied all reduce op.
- **op** (*str*) – Operator, could be 'sum' or 'mean'. Default: 'sum'
- **group** (*torch.distributed.group*, optional) – Distributed group, Default: None.
- **to_float** (*bool*) – Whether to convert all values of dict to float. Default: True.

Returns reduced python dict object.

Return type OrderedDict

`easycv.utils.dist_utils.get_device()`

Returns an available device, cpu, cuda.

`easycv.utils.dist_utils.sync_random_seed(seed=None, device='cuda')`

Make sure different ranks share the same seed. All workers must call this function, otherwise it will deadlock. This method is generally used in *DistributedSampler*, because the seed should be identical across all processes in the distributed group. In distributed sampling, different ranks should sample non-overlapped data in the dataset. Therefore, this function is used to make sure that each rank shuffles the data indices in the same order based on the same seed. Then different ranks could use different indices to select non-overlapped data from the same data list. :param seed: The seed. Default to None. :type seed: int, Optional :param device: The device where the seed will be put on.

Default to 'cuda'.

Returns Seed to be used.

Return type int

`easycv.utils.dist_utils.is_dist_available()`

27.10 easycv.utils.eval_utils module

`easycv.utils.eval_utils.generate_best_metric_name(evaluate_type, dataset_name, metric_names)`

Generate best metric name for different evaluator / different dataset / different metric_names evaluate_type: str dataset_name: None or str metric_names: None str or list[str] or tuple(str)

Returns list[str]

27.11 easycv.utils.flops_counter module

`easycv.utils.flops_counter.get_model_info(model, input_size, model_config, logger)`

get_model_info, check model parameters and Gflops

`easycv.utils.flops_counter.get_model_complexity_info(model, input_res, print_per_layer_stat=True, as_strings=True, input_constructor=None, ost=<_io.TextIOWrapper name='<stdout>' mode='w' encoding='UTF-8'>)`

`easycv.utils.flops_counter.flops_to_string(flops, units='GMac', precision=2)`

`easycv.utils.flops_counter.params_to_string(params_num)`

converting number to string

Parameters `params_num` (float) – number

Returns str number

```
>>> params_to_string(1e9)
'1000.0 M'
>>> params_to_string(2e5)
'200.0 k'
>>> params_to_string(3e-9)
'3e-09'
```

```
easycv.utils.flops_counter.print_model_with_flops(model, units='GMac', precision=3,
                                                  ost=<_io.TextIOWrapper name='<stdout>'
                                                  mode='w' encoding='UTF-8'>)

easycv.utils.flops_counter.get_model_parameters_number(model)

easycv.utils.flops_counter.add_flops_counting_methods(net_main_module)

easycv.utils.flops_counter.compute_average_flops_cost(self)
    A method that will be available after add_flops_counting_methods() is called on a desired net object. Returns
    current mean flops consumption per image.

easycv.utils.flops_counter.start_flops_count(self)
    A method that will be available after add_flops_counting_methods() is called on a desired net object. Activates
    the computation of mean flops consumption per image. Call it before you run the network.

easycv.utils.flops_counter.stop_flops_count(self)
    A method that will be available after add_flops_counting_methods() is called on a desired net object. Stops
    computing the mean flops consumption per image. Call whenever you want to pause the computation.

easycv.utils.flops_counter.reset_flops_count(self)
    A method that will be available after add_flops_counting_methods() is called on a desired net object. Resets
    statistics computed so far.

easycv.utils.flops_counter.add_flops_mask(module, mask)

easycv.utils.flops_counter.remove_flops_mask(module)

easycv.utils.flops_counter.is_supported_instance(module)

easycv.utils.flops_counter.empty_flops_counter_hook(module, input, output)

easycv.utils.flops_counter.upsample_flops_counter_hook(module, input, output)

easycv.utils.flops_counter.relu_flops_counter_hook(module, input, output)

easycv.utils.flops_counter.linear_flops_counter_hook(module, input, output)

easycv.utils.flops_counter.pool_flops_counter_hook(module, input, output)

easycv.utils.flops_counter.bn_flops_counter_hook(module, input, output)

easycv.utils.flops_counter.gn_flops_counter_hook(module, input, output)

easycv.utils.flops_counter.deconv_flops_counter_hook(conv_module, input, output)

easycv.utils.flops_counter.conv_flops_counter_hook(conv_module, input, output)

easycv.utils.flops_counter.batch_counter_hook(module, input, output)

easycv.utils.flops_counter.add_batch_counter_variables_or_reset(module)

easycv.utils.flops_counter.add_batch_counter_hook_function(module)

easycv.utils.flops_counter.remove_batch_counter_hook_function(module)

easycv.utils.flops_counter.add_flops_counter_variable_or_reset(module)

easycv.utils.flops_counter.add_flops_counter_hook_function(module)

easycv.utils.flops_counter.remove_flops_counter_hook_function(module)

easycv.utils.flops_counter.add_flops_mask_variable_or_reset(module)
```

27.12 easycv.utils.gather module

`easycv.utils.gather.gather_tensors(input_array)`

`easycv.utils.gather.gather_tensors_batch(input_array, part_size=100, ret_rank=-1)`

27.13 easycv.utils.json_utils module

Utilities for dealing with writing json strings.

`json_utils` wraps `json.dump` and `json.dumps` so that they can be used to safely control the precision of floats when writing to json strings or files.

class `easycv.utils.json_utils.MyEncoder(*, skipkeys=False, ensure_ascii=True, check_circular=True, allow_nan=True, sort_keys=False, indent=None, separators=None, default=None)`

Bases: `json.encoder.JSONEncoder`

default(o)

Implement this method in a subclass such that it returns a serializable object for `o`, or calls the base implementation (to raise a `TypeError`).

For example, to support arbitrary iterators, you could implement `default` like this:

```
def default(self, o):
    try:
        iterable = iter(o)
    except TypeError:
        pass
    else:
        return list(iterable)
    # Let the base class default method raise the TypeError
    return JSONEncoder.default(self, o)
```

iterencode(o, _one_shot=False)

Encode the given object and yield each string representation as available.

For example:

```
for chunk in JSONEncoder().iterencode(bigobject):
    mysocket.write(chunk)
```

`easycv.utils.json_utils.dump(obj, fid, float_digits=-1, **params)`

Wrapper of `json.dump` that allows specifying the float precision used.

Parameters

- **obj** – The object to dump.
- **fid** – The file id to write to.
- **float_digits** – The number of digits of precision when writing floats out.
- ****params** – Additional parameters to pass to `json.dumps`.

`easycv.utils.json_utils.dumps(obj, float_digits=-1, **params)`

Wrapper of `json.dumps` that allows specifying the float precision used.

Parameters

- **obj** – The object to dump.
- **float_digits** – The number of digits of precision when writing floats out.
- ****params** – Additional parameters to pass to `json.dumps`.

Returns JSON string representation of obj.

Return type output

`easycv.utils.json_utils.compat_dumps(data, float_digits=-1)`

handle json dumps chinese and numpy data :param data python data structure: :param float_digits: The number of digits of precision when writing floats out.

Returns

json str, in python2 , the str is encoded with utf8 in python3, the str is unicode type(python3 str)

`easycv.utils.json_utils.PrettyParams(**params)`

Returns parameters for use with `Dump` and `Dumps` to output pretty json.

Example usage: ``json_str = json_utils.Dumps(obj, **json_utils.PrettyParams())``

```
```json_str = json_utils.Dumps(
 obj, **json_utils.PrettyParams(allow_nans=False))```
```

**Parameters** **\*\*params** – Additional params to pass to `json.dump` or `json.dumps`.

**Returns**

**Parameters that are compatible with `json_utils.Dump` and `json_utils.Dumps`.**

**Return type** params

## 27.14 easycv.utils.logger module

`easycv.utils.logger.get_root_logger(log_file=None, log_level=20)`

Get the root logger.

The logger will be initialized if it has not been initialized. By default a `StreamHandler` will be added. If `log_file` is specified, a `FileHandler` will also be added. The name of the root logger is the top-level package name, e.g., “easycv”.

**Parameters**

- **log\_file** (*str* / *None*) – The log filename. If specified, a `FileHandler` will be added to the root logger.
- **log\_level** (*int*) – The root logger level. Note that only the process of rank 0 is affected, while other processes will set the level to “Error” and be silent most of the time.

**Returns** The root logger.

**Return type** logging.Logger

`easycv.utils.logger.print_log(msg, logger=None, level=20)`

Print a log message.

**Parameters**

- **msg** (*str*) – The message to be logged.

- **logger** (*logging.Logger* | *str* | *None*) – The logger to be used. Some special loggers are: - “root”: the root logger obtained with *get\_root\_logger()*. - “silent”: no message will be printed. - *None*: The *print()* method will be used to print log messages.
- **level** (*int*) – Logging level. Only available when *logger* is a *Logger* object or “root”.

## 27.15 easycv.utils.metric\_distance module

`easycv.utils.metric_distance.LpDistance(query_emb, ref_emb, p=2)`

**Input:** query\_emb: [n, dims] tensor ref\_emb: [m, dims] tensor p : p normalize

**Output:** distance\_matrix: [n, m] tensor

$\text{distance\_matrix}_{i,j} = (\sum_k (a_{i,k}^p - b_{j,k}^p))^{1/p}$

`easycv.utils.metric_distance.DotproductSimilarity(query_emb, ref_emb)`

`easycv.utils.metric_distance.CosineSimilarity(query_emb, ref_emb)`

**Input:** query\_emb: [n, dims] tensor ref\_emb: [m, dims] tensor

**Output:** distance\_matrix: [n, m] tensor

## 27.16 easycv.utils.misc module

`easycv.utils.misc.tensor2imgs(tensor, mean=(0, 0, 0), std=(1, 1, 1), to_rgb=True)`

`easycv.utils.misc.unmap(data, count, inds, fill=0)`

Unmap a subset of item (data) back to the original set of items (of size count)

`easycv.utils.misc.add_prefix(inputs, prefix)`

Add prefix for dict key.

### Parameters

- **inputs** (*dict*) – The input dict with str keys.
- **prefix** (*str*) – The prefix add to key name.

**Returns** The dict with keys wrapped with prefix.

**Return type** dict

`easycv.utils.misc.reparameterize_models(model)`

**reparameterize model for inference, especially for**

1. rep conv block : merge 3x3 weight 1x1 weights

call module `switch_to_deploy` recursively

**Parameters** **model** – nn.Module

`easycv.utils.misc.deprecated(reason)`

This is a decorator which can be used to mark functions as deprecated. It will result in a warning being emitted when the function is used.

```
easycv.utils.misc.encode_str_to_tensor(obj)
```

```
easycv.utils.misc.decode_tensor_to_str(obj)
```

## 27.17 easycv.utils.preprocess\_function module

```
easycv.utils.preprocess_function.bninceptionPre(image, mean=[104, 117, 128], std=[1, 1, 1])
```

### Parameters

- **image** – pytorch Image tensor from PIL (range 0~1), bgr format
- **mean** – norm mean
- **std** – norm val

**Returns** A image norm in 0~255, rgb format

```
easycv.utils.preprocess_function.randomErasing(image, probability=0.5, sl=0.02, sh=0.2, r1=0.3,
mean=[0.4914, 0.4822, 0.4465])
```

```
easycv.utils.preprocess_function.solarize(tensor, threshold=0.5, apply_prob=0.2)
tensor : pytorch tensor
```

```
easycv.utils.preprocess_function.gaussianBlurDynamic(image, apply_prob=0.5)
```

```
easycv.utils.preprocess_function.gaussianBlur(image, kernel_size=22, apply_prob=0.5)
```

```
easycv.utils.preprocess_function.randomGrayScale(image, apply_prob=0.2)
```

```
easycv.utils.preprocess_function.mixUp(image, alpha=0.2)
```

```
easycv.utils.preprocess_function.mixUpCls(data, alpha=0.2)
```

## 27.18 easycv.utils.profiling module

```
easycv.utils.profiling.profile_time(trace_name, name, enabled=True, stream=None, end_stream=None)
Print time spent by CPU and GPU.
```

Useful as a temporary context manager to find sweet spots of code suitable for async implementation.

```
easycv.utils.profiling.benchmark_torch_function(iters, f, *args)
```

```
easycv.utils.profiling.time_synchronized()
```

## 27.19 easycv.utils.py\_util module

```
easycv.utils.py_util.copy_attr(a, b, include=(), exclude=())
```

```
easycv.utils.py_util.get_parent_path(path: str)
get parent path, support oss-style path
```

## 27.20 easycv.utils.registry module

**class** easycv.utils.registry.**Registry**(*name*)

Bases: object

**\_\_init\_\_**(*name*)

Initialize self. See help(type(self)) for accurate signature.

**property** name

**property** module\_dict

**get**(*key*)

**register\_module**(*cls=None, force=False*)

easycv.utils.registry.**build\_from\_cfg**(*cfg, registry, default\_args=None*)

Build a module from config dict.

**Parameters**

- **cfg** (*dict*) – Config dict. It should at least contain the key “type”.
- **registry** (*Registry*) – The registry to search the type from.
- **default\_args** (*dict, optional*) – Default initialization arguments.

**Returns** The constructed object.

**Return type** obj

## 27.21 easycv.utils.test\_util module

Contains functions which are convenient for unit testing.

easycv.utils.test\_util.**get\_tmp\_dir**()

easycv.utils.test\_util.**clear\_all\_tmp\_dirs**()

easycv.utils.test\_util.**replace\_data\_for\_test**(*cfg*)

replace real data with test data

**Parameters** *cfg* – Config object

easycv.utils.test\_util.**RunAsSubprocess**(*f*)

easycv.utils.test\_util.**clean\_up**(*test\_dir*)

easycv.utils.test\_util.**run\_in\_subprocess**(*cmd*)

easycv.utils.test\_util.**dist\_exec\_wrapper**(*cmd, nproc\_per\_node, node\_rank=0, nnodes=1, port='29527',  
addr='127.0.0.1', python\_path=None*)

donot forget init dist in your function or script of cmd `python from mmcv.runner import init\_dist  
init\_dist(launcher='pytorch')`

easycv.utils.test\_util.**is\_port\_used**(*port, host='127.0.0.1'*)

easycv.utils.test\_util.**get\_random\_port**()

easycv.utils.test\_util.**pseudo\_dist\_init**()

easycv.utils.test\_util.**computeStats**(*backend, timings, batch\_size=1, model\_name='default'*)

compute the statistical metric of time and speed

```
easycv.utils.test_util.benchmark(predictor, input_data_list, backend='BACKEND', batch_size=1,
 model_name='default', num=200)
```

evaluate the time and speed of different models

```
class easycv.utils.test_util.DistributedTestCase(methodName='runTest')
```

Bases: unittest.case.TestCase

Distributed TestCase for test function with distributed mode. .. rubric:: Examples

```
import torch from mmcv.runner import init_dist from torch import distributed as dist
```

```
def _test_func(*args, **kwargs): init_dist(launcher='pytorch') rank = dist.get_rank() if rank == 0:
```

```
 value = torch.tensor(1.0).cuda()
```

```
 else: value = torch.tensor(2.0).cuda()
```

```
 dist.all_reduce(value) return value.cpu().numpy()
```

```
class DistTest(DistributedTestCase):
```

```
 def test_function_dist(self): args = () # args should be python builtin type kwargs = {} # kwargs should
 be python builtin type self.start_with_torch(
```

```
 _test_func, num_gpus=2, assert_callback=lambda x: self.assertEqual(x, 3.0), *args,
 **kwargs,
```

```
)
```

```
start_with_torch(func, num_gpus, assert_callback=None, save_all_ranks=False, *args, **kwargs)
```

```
start_with_torchacc(func, num_gpus, assert_callback=None, save_all_ranks=False, *args, **kwargs)
```

```
clean_tmp(tmp_file_list)
```

## 27.22 easycv.utils.user\_config\_params\_utils module

```
easycv.utils.user_config_params_utils.check_value_type(replacement, original)
```

convert replacement's type to original's type, support converting str to int or float or list or tuple

## EASYCV PACKAGE

### 28.1 Subpackages

#### 28.1.1 easycv.file package

##### Submodules

##### easycv.file.base module

```
class easycv.file.base.IOBase
 Bases: object

 static register(options)
 open(path: str, mode: str = 'r')
 exists(path: str) → bool
 move(src: str, dst: str)
 copy(src: str, dst: str)
 copytree(src: str, dst: str)
 makedirs(path: str, exist_ok=True)
 remove(path: str)
 rmtree(path: str)
 listdir(path: str, recursive=False, full_path=False, contains=None)
 isdir(path: str) → bool
 isfile(path: str) → bool
 abspath(path: str) → str
 last_modified(path: str) → datetime.datetime
 last_modified_str(path: str) → str
 size(path: str) → int
 md5(path: str) → str
 re_remote = re.compile('(oss|https?)://')
 islocal(path: str) → bool
 is_writable(path)
```

```
class easycv.file.base.IOLocal
 Bases: easycv.file.base.IOBase

 open(path, mode='r')
 exists(path)
 move(src, dst)
 copy(src, dst)
 copytree(src, dst)
 makedirs(path, exist_ok=True)
 remove(path)
 rmtree(path)
 listdir(path, recursive=False, full_path=False, contains: Optional[Union[List[str], str]] = None)
 isdir(path)
 isfile(path)
 glob(path)
 abspath(path)
 last_modified(path)
 last_modified_str(path)
 size(path: str) → int
```

### [easycv.file.file\\_io module](#)

```
easycv.file.file_io.set_oss_env(ak_id: str, ak_secret: str, hosts: Union[str, List[str]], buckets: Union[str,
 List[str]])
```

```
class easycv.file.file_io.IO(max_retry=10, retry_wait=0.1, max_retry_wait=30)
```

Bases: [easycv.file.base.IOLocal](#)

IO module to support both local and oss io. If access oss file, you need to authorize OSS, please refer to [IO.access\\_oss](#).

```
__init__(max_retry=10, retry_wait=0.1, max_retry_wait=30)
```

Initialize self. See help(type(self)) for accurate signature.

```
access_oss(ak_id: str = "", ak_secret: str = "", hosts: Union[str, List[str]] = "", buckets: Union[str, List[str]]
 = "")
```

If access oss file, you need to authorize OSS as follows:

Method1: from easycv.file import io io.access\_oss(

```
 ak_id='your_accesskey_id', ak_secret='your_accesskey_secret', hosts='your endpoint' or
 ['your endpoint1', 'your endpoint2'], buckets='your bucket' or ['your bucket1', 'your bucket2'])
```

**Method2:** Add oss config to your local file `~/.ossutilconfig`, as follows: More oss config information, please refer to: [https://help.aliyun.com/document\\_detail/120072.html](https://help.aliyun.com/document_detail/120072.html)  [Credentials]

```
language = CH endpoint = your endpoint accessKeyId = your_accesskey_id accessKeySe-
cret = your_accesskey_secret
```

**[Bucket-Endpoint]** bucket1 = endpoint1 bucket2 = endpoint2

Then run the following command, the config file will be read by default to authorize oss.

```
from easycv.file import io io.access_oss()
```

**open**(*full\_path*, *mode*='r')

Same usage as the python build-in *open*. Support local path and oss path.

### Example

```
from easycv.file import io io.access_oss(your oss config) # only oss file need, refer to IO.access_oss #
Write something to a oss file. with io.open('oss://bucket_name/demo.txt', 'w') as f:
```

```
f.write("test")
```

```
Read from a oss file. with io.open('oss://bucket_name/demo.txt', 'r') as f:
```

```
print(f.read())
```

**Parameters** **full\_path** – absolute oss path

**exists**(*path*)

Whether the file exists, same usage as *os.path.exists*. Support local path and oss path.

### Example

```
from easycv.file import io io.access_oss(your oss config) # only oss file need, refer to IO.access_oss ret =
io.exists('oss://bucket_name/dir') print(ret)
```

**Parameters** **path** – oss path or local path

**move**(*src*, *dst*)

Move src to dst, same usage as *shutil.move*. Support local path and oss path.

### Example

```
from easycv.file import io io.access_oss(your oss config) # only oss file need, refer to IO.access_oss
move oss file to local io.move('oss://bucket_name/file.txt', '/your/local/path/file.txt') # move
oss file to oss io.move('oss://bucket_name/file.txt', 'oss://bucket_name/file.txt') # move lo-
cal file to oss io.move('/your/local/file.txt', 'oss://bucket_name/file.txt') # move directory
io.move('oss://bucket_name/dir1', 'oss://bucket_name/dir2')
```

**Parameters**

- **src** – oss path or local path
- **dst** – oss path or local path

**safe\_copy**(*src*, *dst*, *try\_max*=3)

oss always bug, we need *safe\_copy*!

**copy**(*src*, *dst*)

Copy a file from src to dst. Same usage as *shutil.copyfile*. If you want to copy a directory, please use *easycv.io.copypath*

### Example

```
from easycv.file import io io.access_oss(your oss config) # only oss file need, refer to IO.access_oss #
Copy a file from local to oss: io.copy('/your/local/file.txt', 'oss://bucket/dir/file.txt')

Copy a oss file to local: io.copy('oss://bucket/dir/file.txt', '/your/local/file.txt')

Copy a file from oss to oss:: io.copy('oss://bucket/dir/file.txt', 'oss://bucket/dir/file2.txt')
```

#### Parameters

- **src** – oss path or local path
- **dst** – oss path or local path

### **copytree**(*src, dst*)

Copy files recursively from src to dst. Same usage as *shutil.copytree*. If you want to copy a file, please use *easycv.io.copy*.

### Example

```
from easycv.file import io io.access_oss(your oss config) # only oss file need, refer to IO.access_oss # copy
files from local to oss io.copytree(src='/your/local/dir1', dst='oss://bucket_name/dir2') # copy files from
oss to local io.copytree(src='oss://bucket_name/dir2', dst='/your/local/dir1') # copy files from oss to oss
io.copytree(src='oss://bucket_name/dir1', dst='oss://bucket_name/dir2')
```

#### Parameters

- **src** – oss path or local path
- **dst** – oss path or local path

### **listdir**(*path, recursive=False, full\_path=False, contains: Optional[Union[List[str], str]] = None*)

List all objects in path. Same usage as *os.listdir*.

### Example

```
from easycv.file import io io.access_oss(your oss config) # only oss file need, refer to IO.access_oss ret =
io.listdir('oss://bucket/dir', recursive=True) print(ret)
```

#### Parameters

- **path** – local file path or oss path.
- **recursive** – If False, only list the top level objects. If True, recursively list all objects.
- **full\_path** – if full path, return files with path prefix.
- **contains** – substr to filter list files.

return: A list of path.

### **remove**(*path*)

Remove a file or a directory recursively. Same usage as *os.remove* or *shutil.rmtree*.

### Example

```
from easycv.file import io io.access_oss(your oss config) # only oss file need, refer to IO.access_oss #
Remove a oss file io.remove('oss://bucket_name/file.txt')
```

```
Remove a oss directory io.remove('oss://bucket_name/dir/')
```

**Parameters path** – local or oss path, file or directory

**rmtree**(*path*)

Remove directory recursively, same usage as *shutil.rmtree*

### Example

```
from easycv.file import io io.access_oss(your oss config) # only oss file need, refer to IO.access_oss
io.remove('oss://bucket_name/dir_name') # Or io.remove('oss://bucket_name/dir_name/')
```

**Parameters path** – oss path

**makedirs**(*path*, *exist\_ok=True*)

Create directories recursively, same usage as *os.makedirs*

### Example

```
from easycv.file import io io.access_oss(your oss config) # only oss file need, refer to IO.access_oss
io.makedirs('oss://bucket/new_dir/')
```

**Parameters path** – local or oss dir path

**isdir**(*path*)

Return whether a path is directory, same usage as *os.path.isdir*

### Example

```
from easycv.file import io io.access_oss(your oss config) # only oss file need, refer to IO.access_oss
io.isdir('oss://bucket/dir/')
```

**Parameters path** – local or oss path

Return: bool, True or False.

**isfile**(*path*)

Return whether a path is file object, same usage as *os.path.isfile*

### Example

```
from easycv.file import io io.access_oss(your oss config) # only oss file need, refer to IO.access_oss
io.isfile('oss://bucket/file.txt')
```

**Parameters path** – local or oss path

Return: bool, True or False.

**glob**(*file\_path*)

Return a list of paths matching a pathname pattern. .. rubric:: Example

```
from easycv.file import io io.access_oss(your oss config) # only oss file need, refer to IO.access_oss
io.glob('oss://bucket/dir/*.txt')
```

**Parameters** `path` – local or oss file pattern

Return: list, a list of paths.

`abspath(path)`

`authorize(path)`

`last_modified(path)`

`last_modified_str(path)`

`size(path: str) → int`

Get the size of file path, same usage as `os.path.getsize`

### Example

```
from easycv.file import io
io.access_oss(your oss config) # only oss file need, refer to IO.access_oss size
= io.size('oss://bucket/file.txt')
print(size)
```

**Parameters** `path` – local or oss path.

Return: size of file in bytes

**class** `easycv.file.file_io.OSSFile(bucket, path, position=0)`

Bases: object

`__init__(bucket, path, position=0)`

Initialize self. See help(type(self)) for accurate signature.

`write(content)`

`flush(retry=0)`

`close()`

`seek(position)`

**class** `easycv.file.file_io.BinaryOSSFile(bucket, path)`

Bases: object

`__init__(bucket, path)`

Initialize self. See help(type(self)) for accurate signature.

**class** `easycv.file.file_io.NullContextWrapper(obj)`

Bases: object

`__init__(obj)`

Initialize self. See help(type(self)) for accurate signature.

### easycv.file.utils module

`easycv.file.utils.create_namedtuple(**kwargs)`

`easycv.file.utils.is_oss_path(s)`

`easycv.file.utils.is_url_path(s)`

`easycv.file.utils.url_path_exists(url)`

`easycv.file.utils.get_oss_config()`

Get oss config file from env `OSS_CONFIG_FILE`, default file is `~/ossutilconfig`.

`easycv.file.utils.oss_progress(desc)`

```
easycv.file.utils.ignore_oss_error(msg="")
```

```
easycv.file.utils.mute_stderr()
```

## 28.1.2 easycv.runner package

### Submodules

#### easycv.runner.ev\_runner module

```
class easycv.runner.ev_runner.EVRunner(model, batch_processor=None, optimizer=None, work_dir=None,
 logger=None, meta=None, fp16_enable=False)
```

Bases: `mmcv.runner.epoch_based_runner.EpochBasedRunner`

```
__init__(model, batch_processor=None, optimizer=None, work_dir=None, logger=None, meta=None,
 fp16_enable=False)
```

Epoch Runner for easycv, add support for oss IO and file sync.

#### Parameters

- **model** (`torch.nn.Module`) – The model to be run.
- **batch\_processor** (`callable`) – A callable method that process a data batch. The interface of this method should be `batch_processor(model, data, train_mode) -> dict`
- **optimizer** (`dict` or `torch.optim.Optimizer`) – It can be either an optimizer (in most cases) or a dict of optimizers (in models that requires more than one optimizer, e.g., GAN).
- **work\_dir** (`str`, *optional*) – The working directory to save checkpoints and logs. Defaults to None.
- **logger** (`logging.Logger`) – Logger used during training. Defaults to None. (The default value is just for backward compatibility)
- **meta** (`dict` | `None`) – A dict records some import information such as environment info and seed, which will be logged in logger hook. Defaults to None.
- **fp16\_enable** (`bool`) – if use fp16

```
run_iter(data_batch, train_mode, **kwargs)
```

process for each iteration.

#### Parameters

- **data\_batch** – Batch of dict of data.
- **train\_model** (`bool`) – If set True, run training step else validation step.

```
train(data_loader, **kwargs)
```

Training process for one epoch which will iterate through all training data and call hooks at different stages.

**Parameters** **data\_loader** – data loader object for training

```
val(data_loader, **kwargs)
```

Validation step which Deprecated, using evaluation hook instead.

```
save_checkpoint(out_dir, filename_tmpl='epoch_{}.pth', save_optimizer=True, meta=None,
 create_symlink=True)
```

Save checkpoint to file.

#### Parameters

- **out\_dir** – Directory where checkpoint files are to be saved.
- **filename\_tmpl** (*str*, *optional*) – Checkpoint filename pattern.
- **save\_optimizer** (*bool*, *optional*) – save optimizer state.
- **meta** (*dict*, *optional*) – Metadata to be saved in checkpoint.

**current\_lr()**

Get current learning rates.

**Returns**

**Current learning rates of all** param groups. If the runner has a dict of optimizers, this method will return a dict.

**Return type** list[float] | dict[str, list[float]]

**load\_checkpoint** (*filename*, *map\_location=device(type='cpu')*, *strict=False*, *logger=None*)

Load checkpoint from a file or URL.

**Parameters**

- **filename** (*str*) – Accept local filepath, URL, torchvision://xxx, open-mmlab://xxx, oss://xxx. Please refer to docs/source/model\_zoo.md for details.
- **map\_location** (*str*) – Same as torch.load().
- **strict** (*bool*) – Whether to allow different params for the model and checkpoint.
- **logger** (logging.Logger or None) – The logger for error message.

**Returns** The loaded checkpoint.

**Return type** dict or OrderedDict

**resume** (*checkpoint*, *resume\_optimizer=True*, *map\_location='default'*)

Resume state dict from checkpoint.

**Parameters**

- **checkpoint** – Checkpoint path
- **resume\_optimizer** – Whether to resume optimizer state
- **map\_location** (*str*) – Same as torch.load().

## 28.1.3 easycv.toolkit package

### Subpackages

easycv.toolkit.prune package

### Submodules

easycv.toolkit.prune.prune\_utils module

easycv.toolkit.quantize package
